

# New IdentityIQ-Associate Test Labs, Valid IdentityIQ-Associate Test Blueprint

PDF format is pretty much easy to use for the ones who always have their smart devices and love to prepare for SailPoint Certified IdentityIQ Associate Exam (IdentityIQ-Associate) exam from them. Applicants can also make notes of printed IdentityIQ-Associate Exam Material so they can use it anywhere in order to pass SailPoint Certified IdentityIQ Associate Exam (IdentityIQ-Associate) with a good score.

SailPoint IdentityIQ-Associate practice questions are based on recently released SailPoint IdentityIQ-Associate exam objectives. Includes a user-friendly interface allowing you to take the SailPoint IdentityIQ-Associate Practice Exam on your computers, like downloading the PDF, Web-Based SailPoint IdentityIQ-Associate practice test software, and Desktop SailPoint IdentityIQ-Associate practice exam software.

## Valid IdentityIQ-Associate Test Blueprint - IdentityIQ-Associate Test Fee

We have three versions of SailPoint IdentityIQ-Associate guide materials available on our test platform, including PDF, Software and APP online. The most popular one is PDF version of our SailPoint Certified IdentityIQ Associate Exam IdentityIQ-Associate exam questions and you can totally enjoy the convenience of this version, and this is mainly because there is a demo in it, therefore help you choose what kind of IdentityIQ-Associate Practice Test are suitable to you and make the right choice.

## SailPoint IdentityIQ-Associate Exam Syllabus Topics:

| Topic   | Details   |
|---------|---|
| Topic 1 | <ul style="list-style-type: none"><li>• User-Driven Requests: Explains how users submit access requests, what request types are available, and how QuickLink Populations control who can request what for whom.</li></ul> |
| Topic 2 | <ul style="list-style-type: none"><li>• Provisioning: Covers how IdentityIQ provisions access, including triggering actions, provisioning policies, Lifecycle Events, and attribute synchronization.</li></ul>            |
| Topic 3 | <ul style="list-style-type: none"><li>• Governance: Addresses how access certifications are conducted and how policy violations are defined and detected across the organization.</li></ul>                               |

## SailPoint Certified IdentityIQ Associate Exam Sample Questions (Q42-Q47):

### NEW QUESTION # 42

Is this statement accurate about the BeanShell rules used in the aggregation process?  
Rules are required to implement aggregation in IdentityIQ.

- A. No
- B. Yes

**Answer: A**

Explanation:

No. BeanShell rules are not required to implement aggregation in SailPoint IdentityIQ. Aggregation is a standard IdentityIQ function performed through an application definition, connector configuration, schema definition, correlation settings, and aggregation task execution. Many common connectors can aggregate accounts and groups without any custom rule because the connector and schema configuration provide the required instructions for reading objects from the source system.

Rules are used when additional customization is needed. For example, an aggregation rule may transform incoming attribute values, filter records, normalize data, customize correlation behavior, or handle source-specific logic that cannot be expressed through standard configuration. However, this makes rules optional extension points, not mandatory components of aggregation.

A properly configured application can aggregate accounts using its connector settings, account schema, group schema, and aggregation task options alone. Rules should be introduced only when the standard connector behavior and configuration do not satisfy the implementation requirements.

Reference topics: Applications, aggregation tasks, connector configuration, account schema, group schema, correlation options, application rules, connector rules, and IdentityIQ extensibility through BeanShell rules.

### NEW QUESTION # 43

The purpose of marking an attribute as managed when defining the application account schema is to designate it as:  
An attribute that can be edited in IdentityIQ.

- A. No
- B. Yes

**Answer: A**

Explanation:

Marking an account schema attribute as managed does not mean the attribute can be edited in IdentityIQ. In IdentityIQ application schema configuration, a managed attribute is one whose values are promoted into IdentityIQ as governable access objects, commonly represented in the entitlement catalog. This allows IdentityIQ to attach governance metadata to the discovered values, such as display name, description, owner, requestability, classification, and review-related context.

Editability is controlled through different mechanisms, including provisioning policies, forms, workflows, connector capabilities, and provisioning plan operations. An attribute may be managed for governance purposes without being directly editable by a user in IdentityIQ. Conversely, an attribute may be populated during provisioning if the application connector and provisioning policy support it, but that is separate from the schema's managed designation.

The managed setting is therefore about governance, cataloging, and access modeling, not direct modification. It enables IdentityIQ to treat values of that schema attribute as objects that can be reviewed, requested, certified, described, and owned.

Reference topics: Applications - account schema attributes and their functions; Access Modeling - entitlement catalog; Governance - certifications; Provisioning - provisioning policies and attribute handling.

### NEW QUESTION # 44

Is this an accurate statement about preventive policy checking in IdentityIQ?

IdentityIQ can notify the requester when their access request will cause a policy violation.

- A. Yes
- B. No

**Answer: A**

Explanation:

Yes. In SailPoint IdentityIQ, preventive policy checking evaluates proposed access changes before the request is completed or provisioned. When a user submits an access request, IdentityIQ can analyze the requested roles, entitlements, or account changes against configured policies, including separation-of-duty and other access-control policies. If the requested access would create a policy violation, IdentityIQ can present a notification or warning to the requester during the request process.

This notification allows the requester to understand that the requested access conflicts with defined governance rules before the request proceeds further. Depending on configuration, IdentityIQ may allow the request to continue with warning, require additional approval or mitigation, or prevent the request from being submitted. The behavior is controlled by policy configuration, request

workflow, and preventive checking settings.

Therefore, the statement is accurate: IdentityIQ can notify the requester when an access request will cause a policy violation.

Reference topics: Governance, policy detection, preventive policy checking, access request evaluation, policy violations, and User-Driven Requests.

#### NEW QUESTION # 45

Is this statement true about attributes in IdentityIQ?

The value for a specific account attribute can be sourced from several applications.

- A. No
- B. Yes

**Answer: A**

Explanation:

The statement is false. In IdentityIQ, an account attribute is defined within a specific application account schema and represents data stored on an account link for that application. Its value is obtained from the account data aggregated from that particular application connector. For example, an account attribute such as memberOf, department, title, or accountStatus belongs to the account schema of a defined application and is populated from that application's aggregation results.

The concept of sourcing values from several applications applies more directly to identity attributes, not account attributes. Identity attributes reside on the IdentityCube and may be derived from authoritative sources, account links, rules, mappings, or precedence logic across multiple applications. IdentityIQ uses identity attribute configuration to normalize data such as department, location, manager, email, or lifecycle state at the identity level.

Therefore, while multiple applications may contain similarly named account attributes, each account attribute value is tied to its own application account schema and account link. It is not a single shared account attribute sourced from several applications.

Reference topics: Applications - account schema attributes; Identity Modeling - identity attributes versus account attributes; Identity Refresh - updating IdentityCube attributes.

#### NEW QUESTION # 46

Is this statement true for the use of applications?

They are defined in IdentityIQ to represent the systems from which identities are read.

- A. No
- B. Yes

**Answer: A**

Explanation:

The statement is not technically accurate. In SailPoint IdentityIQ, applications are defined to represent external systems, platforms, directories, databases, or resources from which account, group, entitlement, and attribute data are aggregated, and in some cases to which provisioning changes are written. IdentityIQ does not generally "read identities" directly from applications. Instead, it reads account records and associated attributes from applications, then uses identity correlation, authoritative-source logic, and identity refresh processing to construct or update IdentityCubes.

This distinction is fundamental. An application may be an authoritative source, such as an HR system, where account attributes contribute heavily to identity creation and lifecycle state. However, the object read from the source is still an account or source record, not an IdentityIQ identity object. The identity is modeled inside IdentityIQ after aggregation and correlation occur.

Therefore, the more precise statement is that applications represent systems from which IdentityIQ reads account and access data, not systems from which IdentityIQ simply reads identities. Reference topics:

Applications, application definition, account aggregation, authoritative applications, correlation, IdentityCube creation, and Identity Modeling.

#### NEW QUESTION # 47

.....

Recently, IdentityIQ-Associate exam certification, attracting more attention from more and more people in IT industry, has become an important standard to balance someone's IT capability. Many IT candidates are confused and wonder how to prepare for IdentityIQ-Associate exam, but now you are lucky if you read this article because you have found the best method to prepare for

the exam from this article. You will ensure to get IdentityIQ-Associate Exam Certification after using our IdentityIQ-Associate exam software developed by our powerful ExamsTorrent IT team. If you still hesitate, try to download our free demo of IdentityIQ-Associate exam software.
