Huawei HCIA-Cloud Computing V5.5 Sample Questions (Q61-Q66):

NEW QUESTION # 61
Which of the following cloud computing operation models is most suitable for small Internet of Things enterprises?

- A. Hybrid cloud
- B. Community cloud
- C. Public cloud
- D. Private cloud

Answer: A

NEW QUESTION # 62
Which of the following statements is false about the Libvirt component?

- A. Libvirt is a closed-source project. It is a very powerful management tool.
- B. Libvirt provides programming interfaces in multiple languages. You can directly invoke APIs provided by Libvirt to perform operations on VMs.
- C. Both KVM and Xen can invoke APIs provided by Libvirt to manage virtualization platforms.
- D. Libvirt is a set of library functions that are invoked by other technologies to manage VMs on servers.

Answer: A

Explanation:
According to the Huawei HCIA-Cloud Computing curriculum regarding Open Source Virtualization, statement D is FALSE. Libvirt is famously an open-source toolkit and API, licensed under the LGPL. It was specifically designed to provide a stable, long-term abstraction layer for managing different virtualization technologies. It is not a proprietary or "closed-source" product. In fact, its open nature is what allowed it to become the industry standard for managing Linux-based hypervisors.
The other statements accurately describe Libvirt's role in a cloud environment. As noted in statement A, Libvirt is "hypervisor-agnostic," meaning it can manage multiple types of virtualization, including KVM, Xen, QEMU, and even LXC containers. This allows management tools to use a single set of commands regardless of the underlying technology. Statement B is correct because Libvirt provides bindings for numerous programming languages, such as Python, C, and Java, enabling developers to automate VM lifecycle management (start, stop, migrate, snapshot) directly through code. Statement C is also true; Libvirt is essentially a collection of library functions and a daemon (libvirtd) that higher-level management platforms, such as Huawei'sFusionComputeor the open-sourceOpenStack, invoke to communicate with the hardware.
In Huawei's virtualization architecture, Libvirt acts as a crucial middle layer. By using the virsh command- line tool (which is part of the Libvirt package), administrators can perform complex VM operations without needing to understand the specific, low-level command syntax of each different hypervisor. Understanding that Libvirt is open-source and provides this universal management interface is a key learning point for the HCIA exam.
