Exam candidates grow as the coming of the exam. Most of them have little ideas about how to deal with it. Or think of it as a time-consuming, tiring and challenging task to cope with SSCP exam questions. So this challenge terrifies many people. Perplexed by the issue right now like others? Actually, your anxiety is natural, to ease your natural fear of the SSCP Exam, we provide you our SSCP study materials an opportunity to integrate your knowledge and skills to fix this problem.

ISC SSCP (System Security Certified Practitioner) is a globally recognized certification that validates individuals' skills and knowledge in the field of cybersecurity. System Security Certified Practitioner (SSCP) certification is designed for IT professionals who want to prove their expertise in implementing, monitoring, and administering IT infrastructure in accordance with cybersecurity policies and procedures.

ISC SSCP certification is an excellent choice for professionals who want to advance their careers in the field of information security. System Security Certified Practitioner (SSCP) certification is designed to validate an individual's expertise in security operations and administration, which is a critical skill set needed to ensure the security of an organization's information systems. With the increasing demand for information security professionals, the SSCP Certification can help individuals stand out in a competitive job market.

ISC SSCP (System Security Certified Practitioner) Exam is a professional certification exam offered by the International Information System Security Certification Consortium (ISC). SSCP exam aims to test the knowledge and skills of individuals in the area of system security. The SSCP Certification is recognized globally and is considered an important credential for professionals working in the field of information security.

ISC System Security Certified Practitioner (SSCP) Sample Questions (Q1221-Q1226):

NEW QUESTION # 1221

What security problem is most likely to exist if an operating system permits objects to be used sequentially by multiple users without forcing a refresh of the objects?

- A. Denial of service through a deadly embrace.
- **B. Disclosure of residual data.**
- C. Data leakage through covert channels.
- D. Unauthorized obtaining of a privileged execution state.

Answer: B

Explanation:

Section: Security Operation Administration

Explanation/Reference:

This question is asking you to consider the effects of object reuse. Object reuse is "reassigning to subject media that previously contained information. Object reuse is a security concern because if insufficient measures were taken to erase the information on the media, the information may be disclosed to unauthorized personnel." This concept relates to Security Architecture and Design, because it is in level C2: Controlled Access Protection, of the Orange Book, where "The object reuse concept must be invoked, meaning that any medium holding data must not contain any remnants of information after it is release for another subject to use."

NEW QUESTION # 1222

RADIUS incorporates which of the following services?

- A. Authentication server and PIN codes.
- **B. Authentication server as well as support for Static and Dynamic passwords.**
- C. Authentication of clients and dynamic passwords generation.
- D. Authentication of clients and static passwords generation.

Answer: B

Explanation:

Explanation/Reference:

A Network Access Server (NAS) operates as a client of RADIUS. The client is responsible for passing user information to designated RADIUS servers, and then acting on the response which is returned.

RADIUS servers are responsible for receiving user connection requests, authenticating the user, and then returning all configuration information necessary for the client to deliver service to the user.

RADIUS authentication is based on provisions of simple username/password credentials. These credentials are encrypted by the client using a shared secret between the client and the RADIUS server. OIG 2007, Page 513 RADIUS incorporates an authentication server and can make uses of both dynamic and static passwords.

Since it uses the PAP and CHAP protocols, it also includes static passwords.

RADIUS is an Internet protocol. RADIUS carries authentication, authorization, and configuration information between a Network Access Server and a shared Authentication Server. RADIUS features and functions are described primarily in the IETF

(International Engineering Task Force) document RFC2138.

The term "RADIUS" is an acronym which stands for Remote Authentication Dial In User Service.

The main advantage to using a RADIUS approach to authentication is that it can provide a stronger form of authentication. RADIUS is capable of using a strong, two-factor form of authentication, in which users need to possess both a user ID and a hardware or software token to gain access.

Token-based schemes use dynamic passwords. Every minute or so, the token generates a unique 4-, 6- or 8-digit access number that is synchronized with the security server. To gain entry into the system, the user must generate both this one-time number and provide his or her user ID and password.

Although protocols such as RADIUS cannot protect against theft of an authenticated session via some realtime attacks, such as wiretapping, using unique, unpredictable authentication requests can protect against a wide range of active attacks.

RADIUS: Key Features and Benefits

Features Benefits

RADIUS supports dynamic passwords and challenge/response passwords.

Improved system security due to the fact that passwords are not static.

It is much more difficult for a bogus host to spoof users into giving up their passwords or password-generation algorithms.

RADIUS allows the user to have a single user ID and password for all computers in a network.

Improved usability due to the fact that the user has to remember only one login combination.

RADIUS is able to:

Prevent RADIUS users from logging in via login (or ftp).

Require them to log in via login (or ftp)

Require them to login to a specific network access server (NAS);

Control access by time of day.

Provides very granular control over the types of logins allowed, on a per-user basis.

The time-out interval for failing over from an unresponsive primary RADIUS server to a backup RADIUS server is site-configurable.

RADIUS gives System Administrator more flexibility in managing which users can login from which hosts or devices.

NEW QUESTION # 1223

Which of the following can be used as a covert channel?

- A. Storage and low bits.
- **B. Storage and timing.**
- C. Storage and permissions.
- D. Storage and classification.

Answer: B

Explanation:

The Orange book requires protection against two types of covert channels, Timing and Storage.

The following answers are incorrect:

Storage and low bits. Is incorrect because, low bits would not be considered a covert channel.

Storage and permissions. Is incorrect because, permissions would not be considered a covert channel.

Storage and classification. Is incorrect because, classification would not be considered a covert channel.

NEW QUESTION # 1224

Which of the following is an advantage in using a bottom-up versus a top-down approach to software testing?

- A. Major functions and processing are tested earlier.
- B. Confidence in the system is achieved earlier.

- C. Errors in critical modules are detected earlier.
- D. Interface errors are detected earlier.

Answer: C

Explanation:

The bottom-up approach to software testing begins with the testing of atomic units, such as programs and modules, and work upwards until a complete system testing has taken place. The advantages of using a bottom-up approach to software testing are the fact that there is no need for stubs or drivers and errors in critical modules are found earlier. The other choices refer to advantages of a top down approach which follows the opposite path.

NEW QUESTION # 1225

Which type of attack consists of modifying the length and fragmentation offset fields in sequential IP packets?

- A. SYN attack
- B. Buffer overflow attack
- C. Smurf attack
- D. Teardrop attack

Answer: D

Explanation:

Explanation/Reference:

A teardrop attack consists of modifying the length and fragmentation offset fields in sequential IP packets so the target system becomes confused and crashes after it receives contradictory instructions on how the fragments are offset on these packets. A SYN attack is when an attacker floods a system with connection requests but does not respond when the target system replies to those requests. A smurf attack is an attack where the attacker spoofs the source IP address in an ICMP ECHO broadcast packet so it seems to have originated at the victim's system, in order to flood it with REPLY packets. A buffer overflow attack occurs when a process receives much more data than expected.
