UiPath-ADAv1 Latest Exam & New UiPath-ADAv1 Mock Test

Exam4Docs can provide professional and high quality products. It is the industry leader in providing IT certification information. To select Exam4Docs is to choose success. Exam4Docs's UiPath UiPath-ADAv1 Exam Training materials is your magic weapon to success. With it, you will pass the exam and achieve excellent results, towards your ideal place.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q48-Q53):

NEW QUESTION # 48

In a process, a variable called "Timestamp" of type Date Time is used. The developer wants to print in the Output panel the variable in the format "yyyy-MM-dd hh:mm". Which expression should be used to display the value?

- A. Timestamp. ToDate Time("yyyy-MM-dd hh:mm")
- **B. Timestamp. ToString("yyyy-MM-dd hh:mm")**
- C. Timestamp.Compare To("yyyy-MM-dd hh:mm")
- D. Timestamp. ToString("yyyy MM dd hh mm")

Answer: B

Explanation:

To display the value of a `DateTime` variable in a specific format, the `ToString` method should be used with the format specified as a string argument. The correct expression for the "Timestamp" variable to display it in the format "yyyy-MM-dd hh:mm" is `Timestamp.ToString("yyyy-MM-dd hh:mm")`.

Microsoft .NET Documentation: `DateTime.ToString` Method

NEW QUESTION # 49

When installing UiPath Studio, which of the following actions require administrator privileges?

- A. Administrator privileges are required for installing the robot in service mode.
- B. Administrator privileges are required for installing the robot in user mode.
- C. Administrator privileges are not required for installing UiPath Studio.
- D. Administrator privileges are required for installing the robot in both service mode and user mode.

Answer: A

NEW QUESTION # 50

Which is the recommended variable type for storing password values that are composed solely of numbers?

- A. `Int32`
- B. `SecureString`
- C. `Int64`
- D. `String`

Answer: B

Explanation:

The recommended variable type for storing password values, even if they are composed solely of numbers, is `SecureString`. A `SecureString` is designed to provide a more secure way to handle sensitive information as it keeps the data encrypted in memory, making it less vulnerable to potential risks such as memory dumps compared to regular string types.

NEW QUESTION # 51

A developer is building an automation which types text into a text file. The Activity Project Settings for UI Automation Modern activities are set as follows:

□ What is the behavior of the Type Into activity when executing the workflow?

- A. The activity will remove a Single Line in Run mode and Multi Line in Debug mode.
- B. The activity will remove Multi Line in Run mode and a Single Line in Debug mode.
- C. The activity will remove a Single Line in Run mode and in Debug mode.
- D. The activity will use only properties set in Activity Project Settings.

Answer: A

Explanation:

The Type Into activity is used to type text into a UI element. The activity has different properties that can be configured to control the input method, the delay between keystrokes, the cursor position, and the text formatting. The Activity Project Settings for UI Automation Modern activities allow you to set the default values for these properties at the project level. However, you can also override these values at the activity level by using the Properties panel. In this case, the Activity Project Settings are set to remove a Single Line in Run mode and Multi Line in Debug mode. This means that when the workflow is executed, the Type Into activity will delete any existing text in the UI element before typing the new text. If the workflow is run in Run mode, only one line of text will be deleted. If the workflow is run in Debug mode, all lines of text will be deleted. (UiPath Studio documentation1)

NEW QUESTION # 52

A developer invoked a workflow file with three arguments, one "In", one "Out", and one "In/Out". In the Invoked Workflow's Arguments window, how can the Value be configured for each argument?

- A. In: Variable or Hard-coded value
Out Variable or Hard-coded value
In/Out Hard-coded value only
- B. In: Variable only Out
Variable only
In/Out: Variable only
- C. In: Variable or Hard-coded value
Out' Hard-coded value only
In/Out Variable only
- **D. In: Variable or Hard-coded value
Out: Variable only
In/Out Variable only**

Answer: D

Explanation:

Explanation

In the Invoked Workflow's Arguments window, the Value can be configured for each argument as follows:

In: Variable or Hard-coded value. An In argument is an argument that passes a value from the parent workflow to the child workflow. The Value of an In argument can be configured with a variable that holds the value to be passed, or a hard-coded value that is directly entered in the Value field³. For example, if the In argument is Name and the value to be passed is "John", the Value can be configured with a variable that contains "John", such as strName, or a hard-coded value, such as "John".

Out: Variable only. An Out argument is an argument that passes a value from the child workflow to the parent workflow. The Value of an Out argument can be configured only with a variable that receives the value from the child workflow⁴. For example, if the Out argument is Result and the value to be passed is the sum of two numbers, the Value can be configured only with a variable that stores the sum, such as intResult.

In/Out: Variable only. An In/Out argument is an argument that passes a value from the parent workflow to the child workflow, and then passes the modified value back to the parent workflow. The Value of an In/Out argument can be configured only with a variable that holds the initial value and receives the modified value⁵. For example, if the In/Out argument is Counter and the value to be passed is a number that is incremented by one in the child workflow, the Value can be configured only with a variable that contains the initial number and stores the incremented number, such as intCounter.
