最新的 AWS Certified Foundational CLF-C02 免費考試真題 (Q708-Q713):

問題 #708

Which AWS service is a continuous delivery and deployment solution?

- A. AWSAppSync
- B. AWS Cloud9
- C. AWS CodeCommit
- D. AWS CodePipeline

答案: D

解題說明:

AWS CodePipeline is a continuous delivery and deployment service that automates the release process of software applications across different stages, such as source code, build, test, and deploy². AWSAppSync, AWS Cloud9, and AWS CodeCommit are other AWS services related to application development, but they do not provide continuous delivery and deployment solutions³⁴.

問題 #709

A company wants to host its relational databases on AWS. The databases have predefined schemas that the company needs to replicate on AWS.

Which AWS services could the company use for the databases? (Select TWO.)

- A. Amazon DocumentDB (with MongoDB compatibility)
- B. Amazon DynamoDB
- C. Amazon Neptune
- **D. Amazon RDS**
- **E. Amazon Aurora**

答案: D,E

解題說明:

The correct answers are A and B because Amazon Aurora and Amazon RDS are AWS services that the company could use for the relational databases. Amazon Aurora is a relational database that is compatible with MySQL and PostgreSQL. Amazon Aurora is a fully managed, scalable, and high-performance service that offers up to five times the throughput of standard MySQL and up to three times the throughput of standard PostgreSQL. Amazon RDS is a service that enables users to set up, operate, and scale relational databases in the cloud. Amazon RDS supports six popular database engines: MySQL, PostgreSQL, Oracle, SQL Server, MariaDB, and Amazon Aurora. The other options are incorrect because they are not AWS services that the company could use for the relational databases. Amazon DocumentDB (with MongoDB compatibility) is a document database that is compatible with MongoDB. Amazon Neptune is a graph database that supports property graph and RDF models. Amazon DynamoDB is a key-value and document database.

Reference: Amazon Aurora, Amazon RDS

問題 #710

A company is building a mobile app to provide shopping recommendations to its customers. The company wants to use a graph database as part of the shopping recommendation engine.

Which AWS database service should the company choose?

- A. Amazon DocumentDB (with MongoDB compatibility)
- **B. Amazon Neptune**
- C. Amazon Aurora
- D. Amazon DynamoDB

答案: B

解題說明:

Amazon Neptune is a service that provides a fully managed graph database that supports property graphs and RDF graphs. It can be used to build applications that work with highly connected datasets, such as shopping recommendations, social networks, fraud detection, and knowledge graphs². Amazon DynamoDB is a service that provides a fully managed NoSQL database that delivers fast and consistent performance at any scale.

Amazon Aurora is a service that provides a fully managed relational database that is compatible with MySQL and PostgreSQL.

Amazon DocumentDB (with MongoDB compatibility) is a service that provides a fully managed document database that is compatible with MongoDB.

問題 #711

Which AWS service or tool gives a company the ability to release application changes in an automated way?

- A. AWS PrivateLink
- B. Amazon AppFlow
- **C. AWS CodeDeploy**
- D. Amazon EKS Distro

答案: C

問題 #712

A large company has a workload that requires hardware to remain on premises. The company wants to use the same management

and control plane services that it currently uses on AWS.
Which AWS service should the company use to meet these requirements?

- A. AWS Ground Station
- B. AWS Fargate
- C. AWS Device Farm
- **D. AWS Outposts**

答案：D

解題說明：

The correct answer is C because AWS Outposts is an AWS service that enables the company to meet the requirements. AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to virtually any datacenter, co-location space, or on-premises facility. AWS Outposts allows customers to run their workloads on the same hardware and software that AWS uses in its cloud, while maintaining local access and control. The other options are incorrect because they are not AWS services that enable the company to meet the requirements. AWS Device Farm is an AWS service that enables customers to test their mobile and web applications on real devices in the AWS Cloud. AWS Fargate is an AWS service that enables customers to run containers without having to manage servers or clusters. AWS Ground Station is an AWS service that enables customers to communicate with satellites and downlink data from orbit. Reference: AWS Outposts FAQs
