## Cisco Developing Applications using Cisco Core Platforms and APIs (DEVCOR) Sample Questions (Q488-Q493):

### NEW QUESTION # 488

What is a benefit of using continuous testing and static code analysis in a CI pipeline?

- A. They ensure that the product backlog is delivered to the release schedule.
- B. They automate code authoring based on user stories.
- C. They monitor the production environment and send alerts when errors are detected.
- D. They detect source code vulnerabilities as part of the standard build process.

**Answer: D**

Explanation:

Continuous testing and static code analysis are essential components of a CI (Continuous Integration) pipeline because they help identify vulnerabilities, bugs, and code quality issues early in the development lifecycle.

Static code analysis reviews the source code without executing it, detecting security vulnerabilities, syntax errors, and coding standard violations.

Continuous testing automates the execution of unit tests, integration tests, and security scans, ensuring code quality before deployment.

By integrating these practices into the CI pipeline, developers can catch and fix issues early, reducing security risks and improving software reliability.

### NEW QUESTION # 489

An engineer must access multiple bots that are running in an internal infrastructure. A different HTTPS URL is required for each bot. The infrastructure has just one public IP address and a Linux server with Apache installed. Drag and drop the actions from the left into the order of steps on the right to enable access to the bots inside. Not all options are used.

Configure "Let's Encrypt" on the bot servers.	step 1
