CompTIA Security+ Certification Exam Sample Questions (Q569-Q574):

NEW QUESTION # 569

Which of the following outlines the configuration, maintenance, and security roles between a cloud service provider and the customer?

- A. Non-disclosure agreement
- B. **Responsibility matrix**
- C. Memorandum of understanding
- D. Service-level agreement

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

A responsibility matrix, often referred to in cloud computing as the Shared Responsibility Model, defines the exact roles, duties, and expectations between a cloud service provider (CSP) and the customer. This includes who is responsible for configuration, maintenance, patching, logging, updates, identity management, network security, and data protection.

According to the SY0-701 exam objectives, cloud models such as SaaS, PaaS, and IaaS all divide responsibilities differently. The responsibility matrix clarifies these boundaries so that neither party assumes the other is handling a critical security task.

Misunderstandings in these areas can create dangerous security gaps, such as unpatched virtual machines, misconfigured storage buckets, or weak access controls.

A Service-Level Agreement (A) focuses on uptime, performance, and service expectations-not shared security roles. A Memorandum of Understanding (C) describes high-level cooperation between organizations, while an NDA (D) protects confidential information.

The responsibility matrix is emphasized under Security Program Management, specifically in managing third-party relationships and cloud provider governance, ensuring both parties understand their obligations and reducing the risk of misconfigurations or operational vulnerabilities.

NEW QUESTION # 570

A company wants to ensure secure remote access to its internal network. The company has only one public IP and would like to avoid making any changes to the current network setup. Which of the following solutions would best accomplish this goal?

- A. **IPSec VPN**
- B. Reverse proxy
- C. Perimeter network
- D. PAT

Answer: A

NEW QUESTION # 571

Which of the following data roles is responsible for identifying risks and appropriate access to data?

- A. Custodian
- B. **Owner**
- C. Controller
- D. Steward

Answer: B

Explanation:

The data owner is indeed responsible for identifying risks and determining the appropriate access to data.

NEW QUESTION # 572

Which of the following is required for an organization to properly manage its restore process in the event of system failure?

- A. SDLC
- **B. DRP**
- C. RPO
- D. IRP

Answer: B

Explanation:

A disaster recovery plan (DRP) is a set of policies and procedures that aim to restore the normal operations of an organization in the event of a system failure, natural disaster, or other emergency. A DRP typically includes the following elements:

A risk assessment that identifies the potential threats and impacts to the organization's critical assets and processes.

A business impact analysis that prioritizes the recovery of the most essential functions and data.

A recovery strategy that defines the roles and responsibilities of the recovery team, the resources and tools needed, and the steps to follow to restore the system.

A testing and maintenance plan that ensures the DRP is updated and validated regularly. A DRP is required for an organization to properly manage its restore process in the event of system failure, as it provides a clear and structured framework for recovering from a disaster and minimizing the downtime and data loss. NEW QUESTION # 573

Which of the following technologies assists in passively verifying the expired status of a digital certificate?

- A. CSR
- B. TPM
- **C. OCSP**
- D. CRL

Answer: C

Explanation:

The Online Certificate Status Protocol (OCSP) is a technology designed to check the revocation status of digital certificates in real-time without requiring the client to download entire revocation lists. Unlike Certificate Revocation Lists (CRLs), which are periodically updated and can be large, OCSP queries an OCSP responder to receive the status of a specific certificate.

OCSP is considered passive verification because it allows clients to check a certificate's current validity status on-demand without maintaining local copies of revocation data. The OCSP responder returns whether the certificate is valid, revoked, or expired.

Trusted Platform Module (TPM) is hardware for secure key storage, and Certificate Signing Request (CSR) is a request for certificate issuance; neither is used for verifying certificate expiration status.

The differences and roles of OCSP and CRLs are thoroughly covered in the Cryptography and PKI chapter of the SY0-701, where OCSP is highlighted as the more efficient and real-time method to verify certificate status passively#6:Chapter 7 CompTIA Security+ Study Guide#.
