Salesforce Certified MuleSoft Integration Architect I Sample Questions (Q112-Q117):

NEW QUESTION # 112
An architect is designing a Mule application to meet the following two requirements:
1. The application must process files asynchronously and reliably from an FTPS server to a back-end database using VM intermediary queues for load-balancing Mule events.
2. The application must process a medium rate of records from a source to a target system using a Batch Job scope.

To make the Mule application more reliable, the Mule application will be deployed to two CloudHub 1.0 workers.
Following MuleSoft-recommended best practices, how should the Mule application deployment typically be configured in Runtime Manger to best support the performance and reliability goals of both the Batch Job scope and the file processing VM queues?

- A. Check the Persistent VM queues checkbox in the application deployment configuration
- B. In the Runtime Manager Properties tab, enable persistent VM queues for the FTPS connector
- C. Check the Non-persistent VM queues checkbox in the application deployment configuration
- D. In the Runtime Manager Properties tab, disable persistent VM queues for Batch Job scopes

Answer: A

NEW QUESTION # 113
During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.
Which characteristics of a design-first approach will help make this API successful?

- A. Developing a specification so consumers can test before the implementation is built
- B. Publishing the fully implemented API to Exchange so all developers can reuse the API
- C. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- D. Building MUnit tests so administrators can confirm code coverage percentage during deployment

Answer: A

Explanation:
A design-first approach in API development focuses on creating a detailed API specification before any implementation begins. This specification acts as a contract that defines the API's endpoints, request/response formats, and error codes. By developing this specification early, potential consumers can provide feedback, and testing can be conducted against mock implementations to ensure the API meets their needs. This approach helps identify issues early in the development process, improving the likelihood of successful implementation and adoption.

NEW QUESTION # 114
According to MuleSoft, which deployment characteristic applies to a microservices application architecture?

- A. Services exist as independent deployment artifacts and can be scaled -independently of other services
- B. Core business capabilities are encapsulated in a single, deployable application
- C. A deployment to enhance one capability requires a redeployment of all capabilities
- D. All services of an application can be deployed together as single Java WAR file

Answer: A

NEW QUESTION # 115
A platform architect includes both an API gateway and a service mesh in the architect of a distributed application for communication management.
Which type of communication management does a service mesh typically perform in this architecture?

- A. Between services within the application
- B. Between the application and external API clients
- C. Between the application and external API implementations.
- D. Between application services and the firewall

Answer: A

Explanation:
In a distributed application architecture, a service mesh typically manages communication between services within the application. A

service mesh provides a dedicated infrastructure layer that handles service-to-service communication, including service discovery, load balancing, failure recovery, metrics, and monitoring. This allows developers to offload these operational concerns from individual services, ensuring consistent and reliable inter-service communication.

NEW QUESTION # 116

As a part of project requirement, Java Invoke static connector in a mule 4 application needs to invoke a static method in a dependency jar file. What are two ways to add the dependency to be visible by the connectors class loader?

(Choose two answers)

- A. Use Maven command to include the dependency jar file when packaging the application
- B. In the Java Invoke static connector configuration, configure a path and name of the dependency jar file
- C. Add the dependency jar file to the java classpath by setting the JVM parameters
- D. Update mule-artefact.json to export the Java package
- E. Configure the dependency as a shared library in the project POM

Answer: C,E
