### WGU Introduction to IT Sample Questions (Q55-Q60):

#### NEW QUESTION # 55

What is the type of software that has no intellectual property protections?

- A. Shareware
- B. Freeware
- C. Public domain
- D. Closed-source

**Answer: C**

Explanation:

Public domain software has no intellectual property protections such as copyright restrictions. In Information Technology licensing concepts, public domain means the creator has waived copyright or the copyright has expired, so the work can be used freely by anyone. Users can copy, modify, distribute, and reuse the software without needing permission and without paying licensing fees. This is different from freeware, which is free to use but still copyrighted and subject to license limitations. It is also different from shareware, which is typically copyrighted software released as a trial or limited version to encourage purchase of the full product. Closed-source refers to a model where the source code is not provided publicly, but it does not mean there are no intellectual property protections. The key phrase in the question is no intellectual property protections, which aligns directly with public domain status. Therefore, the correct answer is public domain.

#### NEW QUESTION # 56

When would a business intelligence (BI) system be useful in making a decision?

- A. When determining the average salary of the company's executives
- B. When deciding if a restaurant should use more organic food in its menu, based on customer reviews and an analysis of current costs
- C. When deciding whether to promote an employee by looking at their annual sales performance
- D. When figuring out when to reorder store inventory for a particular stock keeping unit (SKU)

**Answer: B**

Explanation:

A BI system shines in this scenario because it leverages the power of data from various sources and turns that into actionable insights:

\*Customer Sentiment Analysis: BI systems can incorporate natural language processing to analyze customer reviews, gauging sentiment and preferences towards organic food. Trends and patterns can be identified.

\*Cost Analysis: BI can pull in data on ingredient costs (organic vs. conventional), preparing a comprehensive analysis of how switching to more organic food would impact operational expenses.

\*Decision Support: By combining customer sentiment, cost analysis, and potentially market trends (through external data integration), a BI system can provide a holistic view of the trade-offs and the potential impact of increasing organic food usage.

### NEW QUESTION # 57

What is the term used to describe additional requirements that are added after project initiation?

- **A. Scope creep**
- B. Nice to have
- C. Cutting corners
- D. Critical path analysis

**Answer: A**

Explanation:

In project management, scope creep refers to the uncontrolled expansion of a project's scope beyond its original boundaries. Here's a breakdown:

1. Project Initiation:

o Project initiation is the first step in starting a new project.

o During this phase, you establish why you're doing the project and what business value it will deliver.

o The goal is to secure buy-in from key stakeholders based on the project's initial definition.

2. Scope Creep:

o Once a project is underway, additional requirements or changes may arise.

o These unplanned additions can lead to scope creep.

o Examples include:

New features requested by stakeholders.

Enhancements beyond the original scope.

Unforeseen requirements emerging during execution.

3. Impact of Scope Creep:

o Scope creep can:

Delay the project timeline.

Increase costs due to additional work.

Affect quality if rushed changes are made.

Create frustration among team members.

4. Managing Scope Creep:

o To prevent scope creep:

Define clear project boundaries during initiation.

Document requirements thoroughly.

Regularly review and assess any proposed changes.

Communicate with stakeholders about trade-offs.

### NEW QUESTION # 58

Which data type should be used to calculate 90% of the retail price of an item?

- **A. Floating-point**
- B. Auto-number
- C. String
- D. Boolean

**Answer: A**

Explanation:

To calculate a percentage of a price, you need a data type that can handle decimal values, as the result may not be a whole number. Here's why a floating-point data type is appropriate:

1. Precision: Floating-point data types are designed to handle numbers that have a fractional part, which is essential for representing percentages accurately.

2. Calculation: When calculating 90% of a retail price, you multiply the price by 0.9. This operation requires a data type that can

represent both the price and the resulting product with decimal precision.

3.Storage: Floating-point types can store a wide range of values with precision, making them suitable for financial calculations where the exact amount matters.

The other options are not suitable for the following reasons:

\*A. Boolean: Can only represent two values, true or false.

\*C. Auto-number: Typically used for unique identifiers and cannot represent fractional values.

\*D. String: While it can represent a number as text, it is not suitable for calculations without conversion, which is inefficient and error-prone.

References: The decision to use a floating-point data type for percentage calculations is supported by best practices in programming and database design, as discussed in various programming forums and documentation<sup>123</sup>. These sources recommend using decimal or floating-point types for financial calculations to ensure accuracy and avoid errors that can arise from binary floating-point representations<sup>2</sup>.
