Data-Architect Real Dump, Data-Architect Certification Dump

Almost everyone is trying to get the Salesforce Data-Architect certification to update their CV or get the desired job. Every student faces just one problem and that is not finding updated study material. Applicants are always confused about where to buy real Salesforce Data-Architect Dumps Questions and prepare for the Salesforce Certified Data Architect (Data-Architect) exam in less time. Nowadays everyone is interested in getting the Salesforce Certified Data Architect (Data-Architect) certificate because it has multiple benefits for Salesforce career.

Salesforce Certified Data Architect Sample Questions (Q77-Q82):

NEW QUESTION # 77

Universal Containers has a legacy system that captures Conferences and Venues. These Conferences can occur at any Venue. They create hundreds of thousands of Conferences per year. Historically, they have only used 20 Venues. Which two things should the data architect consider when denormalizing this data model into a single Conference object with a Venue picklist? Choose 2 answers

- A. Standard list view in -line editing.
- B. Bulk API limitations on picklist fields.
- C. Limitations on master -detail relationships.
- D. Org data storage limitations.

Answer: A,B

Explanation:

When denormalizing a data model into a single object with a picklist field, the data architect should consider the Bulk API limitations on picklist fields and the standard list view in-line editing. The Bulk API has a limit of 1,000 distinct picklist values per file¹, which could be an issue if there are more than 1,000 venues in the future. The standard list view in-line editing allows users to edit multiple records at once, which could introduce data quality issues if the venue picklist is not validated or restricted². The other options are not relevant to denormalizing a data model.

NEW QUESTION # 78

Universal Container has a Sales Cloud implementation for a sales team and an enterprise resource planning (ERP) as a customer master. Sales team are complaining about duplicate account and data quality issues with account data.

Which two solutions should a data architect recommend to resolve the complaints?

- **A. Integrate Salesforce with ERP, and make ERP as system of truth.**
- B. Build a nightly sync job from ERP to Salesforce.
- **C. Implement a de-dupe solution and establish account ownership in Salesforce**
- D. Build a nightly batch job to de-dupe data, and merge account records.

Answer: A,C

Explanation:

Integrating Salesforce with ERP and making ERP the system of truth (option B) and implementing a de-dupe solution and establishing account ownership in Salesforce (option D) are the two solutions that a data architect should recommend to resolve the complaints. Option B ensures that account data is consistent and accurate across both systems, while option D prevents duplicate records and clarifies who owns each account in Salesforce. Building a nightly batch job to de-dupe data and merge account records (option A) is not a good solution, as it does not address the root cause of the duplication and may result in data loss or conflicts. Building a nightly sync job from ERP to Salesforce (option C) is also not sufficient, as it does not prevent duplication or establish ownership in Salesforce.

NEW QUESTION # 79

Universal Containers (UC) is in the process of migrating legacy inventory data from an enterprise resources planning (ERP) system into Sales Cloud with the following requirements:

Legacy inventory data will be stored in a custom child object called Inventory__c.

Inventory data should be related to the standard Account object.

The Inventory object should inherit the same sharing rules as the Account object.

Anytime an Account record is deleted in Salesforce, the related Inventory__c record(s) should be deleted as well.

What type of relationship field should a data architect recommend in this scenario?

- **A. Master-detail relationship field on Inventory__c, related to Account**
- B. Indirect lookup relationship field on Account, related to Inventory__c
- C. Master-detail relationship field on Account, related to Inventory__c
- D. Lookup relationship fields on Inventory related to Account

Answer: A

Explanation:

According to the Salesforce documentation, a relationship field is a field that allows linking one object to another object in Salesforce. There are different types of relationship fields that have different characteristics and behaviors, such as master-detail, lookup, indirect lookup, external lookup, etc.

To recommend a type of relationship field for this scenario, where legacy inventory data will be stored in a custom child object called Inventory__c, inventory data should be related to the standard Account object, the Inventory__c object should inherit the same sharing rules as the Account object, and anytime an Account record is deleted in Salesforce, the related Inventory__c record(s) should be deleted as well, a data architect should recommend:

Master-detail relationship field on Inventory__c, related to Account (option B). This means creating a field on the Inventory__c object that references the Account object as its parent. A master-detail relationship field establishes a parent-child relationship between two objects, where the parent object controls certain behaviors of the child object. For example, a master-detail relationship field can:

Inherit the sharing and security settings from the parent object to the child object. This means that the users who can access and edit the parent record can also access and edit the related child records.

Cascade delete from the parent object to the child object. This means that when a parent record is deleted, all the related child records are also deleted.

Roll up summary fields from the child object to the parent object. This means that the parent object can display aggregated information from the child records, such as count, sum, min, max, or average.

Master-detail relationship field on Account, related to Inventory__c (option A) is not a good solution, as it reverses the direction of the relationship. This means creating a field on the Account object that references the Inventory__c object as its parent. This is not possible, as a standard object cannot be on the detail side of a master-detail relationship. Indirect lookup relationship field on Account, related to Inventory__c (option C) is also not a good solution, as it is a special type of relationship field that allows linking a custom object to a standard object on an external system using an indirect reference. This is not applicable for this scenario, as both objects are in Salesforce and do not need an external reference. Lookup relationship field on Inventory__c related to Account (option D) is also not a good solution, as it establishes a looser relationship between two objects than a master-detail relationship. A lookup relationship field does not inherit sharing and security settings from the parent object to the child object, does not cascade delete from the parent object to the child object, and does not roll up summary fields from the child object to the parent object.

NEW QUESTION # 80

A company has 12 million records, and a nightly integration queries these records.

Which two areas should a Data Architect investigate during troubleshooting if queries are timing out? (Choose two.)

- A. Create a formula field instead of having multiple filter criteria.
- **B. Create custom indexes on the fields used in the filter criteria.**
- C. Modify the integration users' profile to have View All Data.
- **D. Make sure the query doesn't contain NULL in any filter criteria.**

Answer: B,D

NEW QUESTION # 81

An architect has been asked to provide error messages when a future date is detected in a custom Birthdate__c field on the Contact object. The client wants the ability to translate the error messages. What are two approaches the architect should use to achieve this solution? Choose 2 answers

- **A. Create a trigger on Contact and add an error to the record with a custom label.**
- **B. Create a validation rule and translate the error message with translation workbench.**
- C. Implement a third -party validation process with translate functionality.
- D. Create a workflow field update to set the standard ErrorMessage field.

Answer: A,B

Explanation:

Creating a trigger on Contact and adding an error to the record with a custom label allows the architect to use the translation workbench to translate the error message based on the user's language. Creating a validation rule and translating the error message with translation workbench also achieves the same result. The other options would either not provide translation functionality or not display an error message

NEW QUESTION # 82

.....

With the help of the Data-Architect practice exam questions and preparation material offered by DumpsFree, you can pass any Data-Architect certifications exam in the first attempt. You don't have to face any trouble, and you can simply choose to do a selective Data-Architect brain dumps to pass the exam. We offer guaranteed success with Data-Architect Questions on the first attempt, and you will be able to pass the Data-Architect exam in short time. You can always consult our Data-Architect certified professional support if you are facing any problems.
