EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q55-Q60):

NEW QUESTION # 55
Question:
In traditional provisioning, which two factors determine the availability, capacity, and performance of the RAID set?

- A. Make of drives
- B. The RAID level
- C. Capacity of drives
- D. The number of drives in the RAID set

Answer: B,D

Explanation:
In traditional storage provisioning, the RAID configuration significantly impacts the storage system's characteristics:
* RAID Level: Determines data redundancy and fault tolerance. For example, RAID 1 mirrors data, providing high availability, while RAID 5 uses parity, balancing performance and redundancy.
* Number of Drives: Affects both capacity and performance. More drives can increase total storage capacity and improve performance through parallel data access.
* Make of Drives: While drive quality matters, it's less influential than RAID configuration in determining overall system characteristics.
* Capacity of Drives: Impacts total storage size but doesn't directly influence performance or availability as significantly as RAID level and drive count.

NEW QUESTION # 56
Question:
A company needs to rebuild a failed disk in its RAID 5 array. Which two factors would significantly impact the rebuild time?

- A. Capacity of the failed disk
- B. Network bandwidth between the server and the storage array
- C. Write performance of the remaining disks
- D. Capacity of the cache memory

Answer: A,C

Explanation:
Rebuilding a RAID 5 array after a disk failure depends on:
Capacity of the failed disk (C)- More data means longer rebuild time.
Write performance of the remaining disks (B)- Rebuild involves recalculating parity and writing data to the replacement disk, which stresses the surviving disks.
* Network bandwidth (A)is only relevant for accessing the array, not for internal rebuild operations.
* Cache capacity (D)helps performance in some scenarios, but the direct factors are disk size and performance.

NEW QUESTION # 57
Question:
Which two interfaces does an OSD (Object Storage Device) gateway typically present to applications?

- A. File-based interfaces like NFS and CIFS
- B. REST and SOAP APIs
- C. HTTP and HTTPS
- D. SSH and SMB

Answer: B

Explanation:
OSD gateways provide access to object storage systems through APIs. The most common interfaces are:
* REST (Representational State Transfer): A stateless protocol using standard HTTP methods, widely used for web services.
* SOAP (Simple Object Access Protocol): A protocol for exchanging structured information in web services, using XML.

These APIs allow applications to interact with object storage systems over HTTP/HTTPS protocols.
* SSH and SMB: SSH is for secure shell access; SMB is for file sharing, not typically used for object storage.
* HTTP and HTTPS: These are transport protocols; while used by REST and SOAP, they are not interfaces themselves.
* NFS and CIFS: File-based interfaces, not used for object storage.

NEW QUESTION # 58
Question:
Which information is contained in a stub file?

- **A. Address of the archived file**
- B. Hard drive address storing the archived file
- C. Address of the source file
- D. Name and size of the archived file

Answer: A

Explanation:
Astub fileis a small placeholder file that remains on primary storage after data has been archived or moved to secondary storage.
Itcontains a pointer or addressof the archived data's location.
When accessed, the data is transparently retrieved from the archive.
* Address of the source fileand other options do not accurately describe a stub file's purpose.

NEW QUESTION # 59
Question:
What is the role of the storage node in a backup architecture?

- **A. To organize and write data to the backup device**
- B. To manage the backup
- C. To monitor the health of the backup infrastructure
- D. To perform data deduplication and compression

Answer: A

Explanation:
Astorage nodeis a component in a backup architecture that handles the actualdata movementduring the backup process:
Itorganizesthe backup data stream.
Itwritesthe data to the backup target (disk, tape, or cloud).
It does not manage policies or schedules (that's the role of the backup server or management console).
* Option A:Monitoring is done by the backup server or management tools.
* Option C:Backup management (scheduling, policies) is also handled by the backup server.
* Option D:Deduplication may be part of the process but is not theprimary roleof a storage node.
