最新的 Oracle Cloud 1z0-1093-25 免費考試真題 (Q21-Q26):

問題 #21

Which two actions must you undertake when configuring the networking to provide network connectivity for a MySQL HeatWave DB System instance?

- A. Create ingress security rules in the VCN security list or Network Security Groups (NSGs) to allow traffic to the MySQL HeatWave DB System.
- B. Deploy the MySQL HeatWave DB System to a public subnet to allow external connectivity for users.
- C. Configure a dynamic routing gateway for inter-VCN connectivity.
- D. Create egress security rules in the VCN security list or Network Security Groups (NSGs) to block access from the MySQL HeatWave DB System to any outside network.
- E. Ensure the subnet used has a Service Gateway to Oracle Services, such as Object Storage, so that patching can be applied.

答案：A,E

解題說明：

A: Service Gateway for Oracle Services:

- * Ensures the HeatWave DB System can access Oracle Services like Object Storage without using the public internet.
- * Essential for tasks such as patching and backups.

C: Ingress security rules:

- * Allows necessary traffic to reach the HeatWave DB System.
- * Typically, rules will permit MySQL port (3306) and any application-specific ports.
- * Configured using VCN security lists or NSGs.

Why the other options are incorrect:

- * B. Public subnet deployment: Exposes the database to the internet, which is a security risk.
- * D. Dynamic routing gateway: Not mandatory unless inter-VCN connectivity is specifically required.
- * E. Blocking egress entirely: Restricting all outbound traffic can prevent necessary updates and communication with Oracle services.

問題 #22

When considering autoscaling for provisioned throughput in NoSQL Database Cloud Service, which metric is LEAST relevant for determining when to scale up the capacity units?

- A. CPU utilization of the compute instances hosting the database.
- B. Latency of read and write operations.
- C. Number of rejected read requests due to insufficient RCUs.
- D. Number of rejected write requests due to insufficient WCUs.

答案: A

解題說明:

A: CPU utilization of the compute instances hosting the database:

* Autoscaling in NoSQL Database Cloud Service primarily focuses on RCUs (Read Capacity Units) and WCUs (Write Capacity Units).

* The objective is to dynamically adjust capacity based on query workload, not on CPU utilization.

* Even if CPU usage is high, it might not necessarily indicate that the capacity units are inadequate.

Why the other options are more relevant:

* B. Rejected read requests (RCUs): Direct indicator that read capacity is insufficient, requiring scaling.

* C. Rejected write requests (WCUs): Indicates that the write throughput is inadequate, necessitating scaling.

* D. Latency of read and write operations: Increased latency often points to under-provisioned throughput.

問題 #23

In the context of BaseDB Database Lifecycle Management, what is the primary purpose of a "pre-check" utility before applying a patch or upgrading the database?

- A. To determine if the patch or upgrade is compatible with the existing database environment and identify potential conflicts.
- B. To migrate data to a different storage tier.
- C. To automatically back up the database before the patch or upgrade.
- D. To optimize the database performance after the patch or upgrade.
- E. To install the patch or upgrade in a test environment for validation.

答案: A

解題說明:

Purpose of Pre-Check Utility:

The pre-check utility in BaseDB ensures that the database environment is ready for the upcoming patch or upgrade. It checks for:

* Compatibility issues with the existing software and configurations.

* Resource availability (like CPU, memory, and storage).

* Dependencies and prerequisites needed for a successful upgrade. By identifying potential conflicts in advance, pre-checks minimize the risk of upgrade failures and reduce downtime.

Why the other options are incorrect:

* A: Backup is a separate process.

* C: Pre-check does not install or validate in a test environment.

* D: Performance optimization happens post-upgrade.

* E: Data migration is unrelated to the pre-check process.

問題 #24

Which BaseDB lifecycle management activity is MOST directly associated with ensuring the continued availability of a database instance during a planned maintenance window?

- A. Taking a full database backup using RMAN.
- B. Applying a quarterly security patch.
- C. Resizing the block volume storage.
- **D. Using Oracle Data Guard for a switchover operation.**
- E. Performing an in-place upgrade of the database software.

答案： D

解題說明：

C: Using Oracle Data Guard for a switchover operation:

- * A switchover is a planned role reversal between the primary and standby databases.
- * Zero data loss: Since both databases are synchronized, it minimizes downtime.
- * Ideal for planned maintenance: The primary database is switched to the standby, allowing maintenance on the original primary without downtime.
- * Data Guard Switchover:

sql

CopyEdit

```
ALTER DATABASE SWITCHOVER TO standby_db;
```

Why the other options are incorrect:

- * A. Full backup with RMAN: Backup does not ensure availability during maintenance.
- * B. In-place upgrade: Typically involves downtime.
- * D. Quarterly patch: Patching often requires database restarts, causing downtime.
- * E. Resizing block volume: Does not maintain availability if the database requires restarting.

問題 #25

Which two are valid storage options you must select when provisioning Exadata Database Service using the Oracle Cloud Infrastructure (OCI) Console?

- **A. Data disk group encryption using Oracle Cloud Infrastructure Vault.**
- **B. The size of the DATA disk group and RECO disk group.**
- C. Data disk group compression and deduplication algorithm.
- D. The database name and version.
- E. The number of CPUs required for the Exadata Database Service Instance.

答案： A,B

解題說明：

A: Data disk group encryption using OCI Vault provides enhanced security for sensitive data by encrypting data stored within the Exadata storage cells.

B: During provisioning, the size of the DATA and RECO disk groups must be specified. The DATA disk group is used for primary database files, while the RECO disk group is used for recovery-related files.

Why the other options are incorrect:

- * C: CPU count is part of the compute configuration, not storage.
- * D: Compression and deduplication settings are managed at the database level, not during storage configuration.
- * E: Database name and version are part of the database configuration, not storage settings.
