NEW QUESTION # 26
Which FortiSASE feature ensures least-privileged user access to all applications?

- A. thin branch SASE extension
- B. zero trust network access (ZTNA)
- C. secure web gateway (SWG)
- D. SD-WAN

Answer: B

Explanation:
Zero Trust Network Access (ZTNA) is the FortiSASE feature that ensures least-privileged user access to all applications. ZTNA operates on the principle of "never trust, always verify," providing secure access based on the identity of users and devices, regardless of their location.
Zero Trust Network Access (ZTNA):
ZTNA ensures that only authenticated and authorized users and devices can access applications.
It applies the principle of least privilege by granting access only to the resources required by the user, minimizing the potential for unauthorized access.
Implementation:
ZTNA continuously verifies user and device trustworthiness and enforces granular access control policies.
This approach enhances security by reducing the attack surface and limiting lateral movement within the network.

- C. DNS filter
- D. SSL deep inspection

Answer: A,D

* Split DNS Rules:
* Split DNS allows the configuration of specific DNS queries to be directed to internal DNS servers instead of public DNS servers.
* This ensures that internal hostnames are resolved using the organization's internal DNS infrastructure, maintaining privacy and accuracy for internal network resources.

* Split Tunneling Destinations:
* Split tunneling allows specific traffic (such as DNS queries for internal domains) to be routed through the VPN tunnel while other traffic is sent directly to the internet.
* By configuring split tunneling destinations, you can ensure that DNS queries for internal hostnames are directed through the VPN to the internal DNS servers.
