There is no denying that no exam is easy because it means a lot of consumption of time and effort. Especially for the upcoming HPE7-A01 exam, although a large number of people to take the exam every year, only a part of them can pass. If you are also worried about the exam at this moment, please take a look at our HPE7-A01 Study Materials which have become the leader in this career on the market. And if you have a try on our HPE7-A01 preparation quiz, you will be satisfied.

HPE7-A01 certification exam is a crucial credential for IT professionals who specialize in enterprise-level wireless networks. HPE7-A01 exam validates an individual's skills and knowledge in designing, implementing, and managing secure wireless networks using Aruba's products and technologies. Individuals who earn the HPE7-A01 certification demonstrate their expertise in Aruba's wireless access solutions, making them valuable assets to any organization that uses Aruba's products.

HP HPE7-A01 Exam comprises 60 multiple-choice questions that need to be completed within 90 minutes. HPE7-A01 exam is available in different languages, including English, Spanish, Japanese, and Simplified Chinese. Candidates who pass the exam are awarded the Aruba Certified Access Professional (ACCP) certification, which validates their expertise in wireless network design and deployment.

If you have any question about our HPE7-A01 test torrent, do not hesitate and remember to contact us. we are glad to help you

solve your problem. If you buy our Aruba Certified Campus Access Professional Exam guide torrent and take it seriously consideration, you will find you can take your exam after twenty to thirty hours' practice. So come to buy our HPE7-A01 Test Torrent, it will help you pass your exam and get the certification in a short time that you long to own.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q67-Q72):

NEW QUESTION # 67

You are building a configuration in Central that will be used for a standardized network design for small sites for your company, you want to use GUI configuration for gateways and Aps, while template configuration for switches. You need to align with Aruba best practices.

Which set of actions will satisfy these requirements?

- A. Create one group in Central for switches and a second group for APs and gateways. Create a unique site for each location, and assign devices to the appropriate site.
- **B. Create one group in Central for switches a second group for APs. and a third group for gateways Create a unique site for each location, and assign devices to the appropriate site.**
- C. Create a single group in Central. Create a unique site for each location, and assign devices to the appropriate site.
- D. Create a single group in Central. Create a unique site for each type of device, and assign devices to the appropriate site.

Answer: B

Explanation:

When configuring a standardized network design for small sites in Aruba Central, following Aruba's best practices typically involves grouping different types of devices and creating unique sites for each location. Since you want to use GUI configuration for gateways and APs while using template configuration for switches, it means you need to manage these device types separately.

This approach allows you to manage devices grouped by device type, while providing customized configurations for each site. Creating separate groups helps better manage device configurations and policies, especially when using different methods of configuration (GUI and template).

NEW QUESTION # 68

Your customer is having connectivity issues with a newly-deployed Microbranch group The access points in this group are online in Aruba Central, but no VPN tunnels are forming.

What is the most likely cause of this issue?

- A. The gateway group is running in automatic cluster mode and should be in manual cluster mode
- B. There is a time difference between the AP and the gateways The gateways should have NTP added
- **C. There may be a firewall blocking GRE tunneling between the AP and the gateway**
- D. The SSL certificate on the gateway used to encrypt the connection has not been added to the APs trust list

Answer: C

Explanation:

This is the most likely cause of the issue where the access points in a Microbranch group are online in Aruba Central, but no VPN tunnels are forming. A Microbranch group is a group that contains both APs and Gateways and allows them to form VPN tunnels for secure communication. The VPN tunnels use GRE (Generic Routing Encapsulation) as the encapsulation protocol and IPSec as the encryption protocol. If there is a firewall blocking GRE traffic between the AP and the gateway, the VPN tunnels cannot be established.

The other options are incorrect because they either do not affect the VPN tunnel formation or do not apply to a Microbranch group.

NEW QUESTION # 69

With the Aruba CX 6100 48G switch with uplinks of 1/1/47 and 1/1/48. how do you automate the process of resuming the port operational state once a loop on a client port is cleared?

- A. Configure int 1/1/1-1/1/52 loop-protect disable timer.
- B. Configure global loop-protect disable timer.

- C. Configure int 1/1/1-1/1/46 loop-protect re-enable-timer.
- D. Configure global loop-protect re-enable-timer.

Answer: C

Explanation:

Loop protection is a feature that detects and prevents loops in layer 2 networks. Loop protection can be enabled on ports, LAGs, or VLANs. When loop protection is enabled, the switch sends periodic loop protection messages on the interface and expects to receive them back. If a loop protection message is received back on the same interface, it indicates a loop and the switch takes an action to disable the interface or block traffic on it. The loop-protect re-enable-timer command is used to configure the length of time the switch waits before re-enabling an interface that was disabled due to loop detection. The default value is 0, which means that the interface remains disabled until manually re-enabled. To automate the process of resuming the port operational state once a loop on a client port is cleared, the loop-protect re-enable-timer command can be used with a non-zero value on the interface range that includes the client ports. Therefore, answer C is correct.

NEW QUESTION # 70

Drag and Drop Question

Match the topics of an AOS10 Tunneled mode setup between an AP and a Gateway. (Options may be used more than once or not at all.)

Answer:

Explanation:

NEW QUESTION # 71

Refer to Exhibit:

Name (Profile)	Security	Access Type	Traffic forwarding mode	Network Enabled
secure_wireless	wpa3-aes-gcm-256	Role-based	Bridge	Yes
open_wireless	opensystem	Unrestricted	Bridge	Yes

A company has deployed 200 AP-635 access points. To take advantage of the 6 GHz band, the administrator has attempted to

configure a new WPA3-OWE SSID in Central but is not working as expected.
What would be the correct action to fix the issue?

- A. Change the SSID to WPA3-Enterprise (CCM).
- **B. Change the SSID to WPA3-Enhanced Open.**
- C. Change the SSID to WPA3-Enterprise (CNSA).
- D. Change the SSID to WPA3-Personal.

Answer: B

Explanation:

The correct action to fix the issue is C. Change the SSID to WPA3-Enhanced Open.

WPA3-OWE is not a valid SSID type in Central. OWE stands for Opportunistic Wireless Encryption, and it is a feature that provides encryption for open networks without requiring authentication. OWE is also known as Enhanced Open, and it is one of the options for WPA3 SSIDs in Central.

According to the Aruba document *Configuring WLAN Settings for an SSID Profile*, one of the steps to configure a WPA3 SSID is:

* Select the Security Level from the drop-down list. The following options are available:

* WPA3-Personal: This option uses Simultaneous Authentication of Equals (SAE) to provide stronger password-based authentication and key exchange than WPA2-Personal.

* WPA3-Enterprise: This option uses 192-bit cryptographic strength for authentication and encryption, as defined by the Commercial National Security Algorithm (CNSA) suite.

* WPA3-Enterprise (CCM): This option uses 128-bit cryptographic strength for authentication and encryption, as defined by the Counter with CBC-MAC (CCM) mode.

* WPA3-Enhanced Open: This option uses Opportunistic Wireless Encryption (OWE) to provide encryption for open networks without requiring authentication.

The other options are incorrect because:

* A. WPA3-Enterprise (CNSA) is a valid SSID type, but it requires 802.1X authentication with a RADIUS server, which may not be suitable for the company's use case.

* B. WPA3-Personal is a valid SSID type, but it requires a passphrase to join the network, which may not be suitable for the company's use case.

* D. WPA3-Enterprise (CCM) is a valid SSID type, but it requires 802.1X authentication with a RADIUS server, which may not be suitable for the company's use case.

NEW QUESTION # 72

.....

We are here to lead you on a right way to the success in the HP certification exam and save you from unnecessary hassle. Our HPE7-A01 braindumps torrent are developed to facilitate our candidates and to validate their skills and expertise for the HPE7-A01 Practice Test. We are determined to make your success certain in HPE7-A01 real exams and stand out from other candidates in the IT field.
