### Salesforce Certified MuleSoft Associate Sample Questions (Q31-Q36):

#### NEW QUESTION # 31

An organization's IT team follows an API-led connectivity approach and must use Anypoint Platform to implement a System API that securely accesses customer data. The organization uses Salesforce as the system of record for all customer data and its most important objective is to reduce the overall development time to release the System API. The team's integration architect has identified four different approaches to access the customer data from within the implementation of the System API by using different Anypoint Connectors that all meet the technical requirements of the project. Which approach should the team choose to meet the organization's objective to reduce the time to develop and release the System API?

- A. Use the Anypoint Connector for FTP to download a file containing a recent near-real time extract of the customer data
- B. Use the Anypoint Connector for Database to connect to a MySQL database to access a copy of the customer data
- C. Use the Anypoint Connector for HTTP to connect to the Salesforce APIs to directly access the customer data
- **D. Use the Anypoint Connector for Salesforce to connect to the Salesforce APIs to directly access the customer data**

**Answer: D**

Explanation:

In an API-led connectivity approach, using the most efficient method to access system data can significantly reduce development time. Here's why using the Anypoint Connector for Salesforce is the best approach:

Direct Access:

Salesforce APIs: The Anypoint Connector for Salesforce provides direct access to Salesforce APIs, allowing the System API to retrieve customer data efficiently and securely.

No Middleware: Directly accessing Salesforce eliminates the need for intermediary steps, reducing complexity and potential points of failure.

Reduced Development Time:

Out-of-the-Box Functionality: The connector offers pre-built operations and functionalities tailored for Salesforce, speeding up development.

Configuration Over Coding: Using the connector involves minimal configuration compared to coding custom integration logic, leading to faster implementation.

Security:

Built-in Security: The connector handles authentication and authorization, ensuring secure data access in line with Salesforce security protocols.

Alternative Approaches:

HTTP Connector: While functional, it requires more custom handling for Salesforce API interactions and error management.

Database Connector: Accessing a database copy of Salesforce data may involve data synchronization challenges and does not provide real-time data.

FTP Connector: Using FTP for data extracts is less efficient and introduces delays in accessing up-to-date information.

### NEW QUESTION # 32

An application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway Which protocol is involved in the communication between the load balancer and the Gateway?

- A. SFTP
- B. SMTP
- C. LDAP
- **D. HTTPS**

**Answer: D**

Explanation:

In scenarios where an application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway, HTTPS is the protocol used. Here's a detailed explanation:

HTTPS Protocol:

Definition: HTTPS (HyperText Transfer Protocol Secure) is an extension of HTTP that provides secure communication over a computer network.

Encryption: It uses SSL/TLS to encrypt the data exchanged between the client and server, ensuring privacy and data integrity.

Load Balancer to Gateway Communication:

Secure Communication: The load balancer routes incoming requests to the API Gateway using HTTPS, ensuring that the data is encrypted and secure.

Standard Practice: HTTPS is the standard protocol for securing API communications, protecting against eavesdropping and man-in-the-middle attacks.

HTTPS Protocol: What is HTTPS?

API Gateway Security: Anypoint Flex Gateway

### NEW QUESTION # 33

According to MuleSoft which principle is common to both Service Oriented Architecture (SOA) and API-led connectivity approaches\*?

- **A. Service reusability**
- B. Service centralization
- C. Service statefulness
- D. Service interdependence

**Answer: A**

Explanation:

Both Service-Oriented Architecture (SOA) and API-led connectivity emphasize the principle of service reusability. Here's a detailed explanation:

Service Reusability:

Definition: Service reusability is the principle where services are designed to be reusable across different applications and use cases.  
SOA: In SOA, services are modular components that can be reused in various business processes, reducing redundancy and promoting efficient service composition.

API-led Connectivity: This approach also stresses creating reusable APIs (System APIs, Process APIs, Experience APIs) that can be leveraged across multiple projects and applications.

Benefits:

Efficiency: Reduces development time and effort by reusing existing services.

Consistency: Ensures consistency in business logic and data access across different applications.

Scalability: Facilitates scaling by using standardized and reusable services/APIs.

### NEW QUESTION # 34

A high-volume eCommerce retailer receives thousands of orders per hour and requires notification of its order management warehouse, and billing systems for subsequent processing within 15 minutes of order submission through its website. Which integration technology, when used for its typical and intended purpose, meets the retailer's requirements for this use case?

- A. Publish/Subscribe Messaging Bus (Pub/Sub)
- B. Extract Transform Load (ETL)
- C. Enterprise Data Warehouse (EDW)
- D. Managed File Transfer (MFT)

**Answer: A**

Explanation:

For a high-volume eCommerce retailer requiring real-time or near-real-time notifications to multiple systems, a Publish/Subscribe Messaging Bus is an ideal choice. Here's a detailed explanation:

Publish/Subscribe Model:

Definition: The Pub/Sub messaging model allows messages to be sent (published) by producers and received (subscribed to) by multiple consumers.

Asynchronous Communication: It decouples the sender and receiver, enabling asynchronous communication.

Use Case Fit:

Real-Time Processing: Suitable for scenarios requiring real-time or near-real-time data processing and notification.

Scalability: Handles high volumes of messages efficiently, making it suitable for environments with thousands of transactions per hour.

Implementation:

Message Broker: A message broker (e.g., Apache Kafka, RabbitMQ) can manage the distribution of messages to the order management, warehouse, and billing systems.

Guaranteed Delivery: Ensures that messages are reliably delivered to all subscribed systems within the required time frame.

Pub/Sub Messaging: Understanding Publish/Subscribe Messaging

High-Volume Data Processing: Apache Kafka Use Cases

### NEW QUESTION # 35

According to MuleSoft which deployment characteristic applies to a microservices application architecture?

- A. Services exist as independent deployment artifacts and can be scaled independently of other services
- B. A deployment to enhance one capability requires a redeployment of all capabilities
- C. All services of an application can be deployed together as single Java WAR file
- D. Core business capabilities are encapsulated in a single deployable application

**Answer: A**

Explanation:

Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:

Independent Deployment:

Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.

Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.

Benefits:

Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.  
 Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.  
 Technology Diversity: Allows the use of different technologies and languages best suited for each service.  
 Microservices Architecture: What are Microservices?
