CompTIA A+ Certification Exam: Core 2 Sample Questions (Q298-Q303):

NEW QUESTION # 298

A customer called the help desk to report that a machine that was recently updated is no longer working. The support technician checks the latest logs to see what updates were deployed, but nothing was deployed in more than three weeks. Which of the following should the support technician do to BEST resolve the situation?

- A. Put the customer on hold and escalate the call to a manager.
- **B. Use open-ended questions to further diagnose the issue.**
- C. Offer to wipe and reset the device for the customer.
- D. Advise that the help desk will investigate and follow up at a later date.

Answer: B

Explanation:

Explanation

Open-ended questions are questions that require more than a yes or no answer and encourage the customer to provide more details and information. Using open-ended questions can help the support technician to understand the problem better, identify the root cause, and find a suitable solution. Some examples of open-ended questions are:

What exactly is not working on your machine?

When did you notice the problem?

How often does the problem occur?

What were you doing when the problem happened?

What have you tried to fix the problem?

Offering to wipe and reset the device for the customer is not a good option, as it may result in data loss and inconvenience for the customer. It should be used as a last resort only if other troubleshooting steps fail.

Advising that the help desk will investigate and follow up at a later date is not a good option, as it may leave the customer unsatisfied and frustrated. It should be used only if the problem requires further research or escalation and cannot be resolved on the first call.

Putting the customer on hold and escalating the call to a manager is not a good option, as it may waste time and resources. It should be used only if the problem is beyond the support technician's scope or authority and requires managerial intervention.

NEW QUESTION # 299

Users access files in the department share. When a user creates a new subfolder, only that user can access the folder and its files. Which of the following will MOST likely allow all users to access the new folders?

- **A. Enabling inheritance**
- B. Removing archive attribute
- C. Requiring multifactor authentication
- D. Assigning share permissions

Answer: A

Explanation:

Enabling inheritance is a method that allows new subfolders to inherit the permissions and settings from their parent folder. If users can access files in the department share, but not in the new subfolders created by other users, it may indicate that inheritance is disabled and that each new subfolder has its own permissions and settings that restrict access to only the creator. Enabling inheritance can help resolve this issue by allowing all users to access the new subfolders with the same permissions and settings as the department share. Assigning share permissions, requiring multifactor authentication, and removing archive attribute are not methods that can most likely allow all users to access the new folders.

NEW QUESTION # 300

Internet speeds on a user's Windows 10 device are slow, but other devices on the same network are running at normal speeds. A technician thinks the issue may be related to the proxy settings. Which of the following should the technician check to verify the proxy configuration?

- A. Network and Sharing Center
- B. System settings
- C. **Internet Options**
- D. Firewall settings

Answer: C

Explanation:

The correct place to check proxy settings in Windows 10 is under Internet Options (Option B), specifically in the "Connections" tab. Proxy configurations can affect internet speeds if misconfigured or if a proxy is being used unnecessarily.

- * Network and Sharing Center (Option A) provides information on network connections but doesn't handle proxy settings.
- * Firewall settings (Option C) manage network traffic rules but don't directly affect proxy settings.
- * System settings (Option D) contain general system configurations, not specific to proxy settings.

NEW QUESTION # 301

A technician is investigating a workstation that has not received the latest policy changes. Which of the following commands should the technician use to apply the latest domain policy changes?

- A. sfc /scannow
- B. xcopy Zp
- C. chkdsk /y
- D. **gpupdate /force**

Answer: D

Explanation:

When a workstation has not received the latest policy changes, the gpupdate command is used to manually apply the latest group policies from the domain controller.

Option A: sfc /scannow

This command is used to scan and repair corrupted system files, not to update group policies.

Option B: gpupdate /force

This command forces the workstation to reapply all group policies, ensuring that the latest policies are applied immediately.

Option C: chkdsk /y

This command checks the integrity of the file system and fixes logical file system errors, not to update group policies.

Option D: xcopy /Zp

This command is used for copying files and directories, not for updating group policies.

NEW QUESTION # 302

A company is deploying mobile phones on a one-to-one basis, but the IT manager is concerned that users will root/jailbreak their phones. Which of the following technologies can be implemented to prevent this issue?

- A. SSO
- B. Signed system images
- C. Antivirus
- D. **MDM**

Answer: D

Explanation:

MDM stands for Mobile Device Management, and it is a way of remotely managing and securing mobile devices that are used for work purposes¹. MDM can enforce policies and restrictions on the devices, such as preventing users from installing unauthorized apps, modifying system settings, or accessing root privileges²

MDM can also monitor device status, wipe data, lock devices, or locate lost or stolen devices.
