問題 #41

An organization configures an ArcGIS Enterprise portal to allow single sign-on using Integrated Windows Authentication (IWA). Configuration includes:

- * All accounts in the Active Directory group gisusers are added to the portal
- * Existing users can sign in without entering credentials However, new employees assigned to the same gisusers group cannot log in, create content, or join groups. What is causing this issue for the new employees?

- A. Their Active Directory accounts have not been added to the portal
- B. Their Active Directory accounts have been assigned an incompatible default user type
- C. The Web Adaptor cache must be cleared
- D. Their Active Directory accounts have not had sufficient time to sync to the portal

答案： A

解題說明：

For IWA authentication, Active Directory users are not automatically added to the ArcGIS Enterprise portal. They must either be:

- * Manually added as members, or
- * Automatically created at first login if auto-creation is enabled.

Since the new users are assigned to the gisusers group but cannot sign in or create content, it's clear that their accounts have not yet been added to the portal.

From ArcGIS Enterprise documentation:

"Integrated Windows Authentication (IWA) allows users to sign in with their Windows credentials. However, users must still be members of the portal. You can manually add users or enable automatic account creation during login."

- * Option B is invalid since default user type settings do not prevent login.
- * Option C is incorrect because synchronization is not time-based-it's account-creation dependent.

問題 #42

A GIS administrator works for the Department of Transportation. Users need to analyze decades of traffic and crash data to determine the interstates with the most incidents. They will also analyze when certain vehicles were speeding and braking, and then correlate this data with vehicular accident locations.

Which server must be configured to support this workflow?

- A. Notebook Server
- B. GeoAnalytics Server
- C. GeoEvent Server

答案： C

問題 #43

An ArcGIS Enterprise deployment is expanding one of its ArcGIS Server sites from one to three machines because some services now require additional resources. Half the services use a shared instance, and the other half includes dedicated instances.

What will happen to the minimum number of ArcSOCs running on the site?

- A. The same number of ArcSOCs will be running
- B. One and a half times as many ArcSOCs will be running
- C. Three times as many ArcSOCs will be running

答案： C

解題說明：

When expanding an ArcGIS Server site from one to three machines, the number of ArcSOC processes (service instances) will increase proportionally. For dedicated instances, each service's minimum and maximum instances are configured per machine, so tripling the number of machines will triple the number of dedicated ArcSOCs. For shared instances, the shared instance pool runs on each machine, and the number of shared instances is configured per machine. Therefore, the total number of ArcSOCs (both dedicated and shared) will be approximately three times greater after the expansion

問題 #44

A GIS administrator installs and configures an ArcGIS GeoAnalytics Server machine with four cores and 16 GB of RAM. Users experience a slowdown when analyzing large datasets.

Which action should the administrator perform?

- A. Add 16 GB of RAM to the GeoAnalytics Server machine
- B. Add two cores to the GeoAnalytics Server machine
- C. Set the GeoAnalytics Server as the hosting server

答案：A

解題說明：

ArcGIS GeoAnalytics Server is designed to perform distributed analysis on large volumes of spatial and temporal data. To efficiently process large datasets, it is recommended that each machine in the GeoAnalytics Server site has at least 16 GB of RAM and 4 CPU cores. However, for optimal performance, especially when handling very large datasets, increasing the available RAM can significantly improve processing times.

In this scenario, the machine already has 16 GB of RAM and 4 cores. Adding more RAM would allow the GeoAnalytics Server to allocate more memory per job, enhancing its ability to process large datasets efficiently. Therefore, the recommended action is to add 16 GB of RAM to the GeoAnalytics Server machine.

問題 #45

A GIS administrator is analyzing the usage statistics of ArcGIS Enterprise. The administrator needs to pull tabular statistics on various groups and users about the type of content that they produce and consume.

Which action should the administrator perform?

- A. Use ArcGIS Monitor to capture desired information over a period of time in a report.
- **B. Open ArcGIS Server statistics to create a report for commonly used items.**
- C. Run usage reports in Portal for ArcGIS to determine the effect on the organization.

答案：B
