## NCP-MCA Test Pattern - NCP-MCA Dumps Download

Dear customers, we would like to make it clear that learning knowledge and striving for certificates of exam is a self-improvement process, and you will realize yourself rather than offering benefits for anyone. So our NCP-MCA practice materials are once a lifetime opportunity you cannot miss. With all advantageous features introduced as follow, please read them carefully.

## Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q33-Q38):

### NEW QUESTION # 33

An administrator creates a blueprint to deploy VMs to multiple clouds, so that business will remain functional in the event of a disaster.

What component describes this feature?

- A. Profile Actions
- B. Package
- C. Service
- **D. Substrates**

**Answer: D**

Explanation:

Substrates are the components of a blueprint that define the cloud resources and configurations for deploying VMs or applications. Substrates can be associated with different cloud accounts, such as AWS, Azure, GCP, or Nutanix, to enable multicloud deployments. By using substrates, an administrator can create a blueprint that can deploy VMs to multiple clouds, depending on the availability, cost, or performance requirements.

### NEW QUESTION # 34

What is included in the PagerDuty Integration service during configuration?

- **A. Plays**
- B. Alert Grouping
- C. Manual Parameter
- D. reports

**Answer: A**

Explanation:

The PagerDuty Integration service allows you to create and manage incidents in PagerDuty based on events in Nutanix X-Play. To configure the PagerDuty Integration service, you need to provide the following information:

Service Name: The name of the PagerDuty service that you want to integrate with X-Play.

API Key: The API key generated from the PagerDuty service settings.

Plays: The plays that you want to trigger incidents in PagerDuty. You can select one or more plays from the list of available plays in X-Play. You can also specify the incident priority, escalation policy, and alert details for each play.

Alert Grouping: (Optional) The alert grouping strategy that you want to use for the PagerDuty incidents. You can choose from the following options:

Intelligent: PagerDuty will group alerts based on their content and context.

Time: PagerDuty will group alerts based on the time they are received.

None: PagerDuty will not group alerts and create a new incident for each alert. Reference: Nutanix Multicloud Automation Administration (NMCAA) course, Nutanix Certified Professional - Multicloud Automation (NCP-MCA) 6.5 Exam Guide, Process Automation | PagerDuty

### NEW QUESTION # 35

A company wants to ensure that all developers are able to request new development environments on demand by using ServiceNow.

The administrator notices that even though developers create new environments, they rarely remove these environments when moving on to new assignments. Today, the administrator has gone into Prism Central to check when the VM was created, in order to reach out to the developer and ask if it can be deleted. The administrator has accidentally deleted the wrong VM in the past.

Which two methods can the administrator use to automate this task to avoid deleting the incorrect VMs?

(Choose two.)

- **A. Create a playbook webhook action to delete the VM from a ServiceNow approval flow.**
- B. Create a playbook REST API trigger to delete the VM from a ServiceNow approval flow.
- **C. Create a playbook REST API action to delete the VM from a ServiceNow approval flow.**
- D. Create a playbook webhook trigger to delete the VM from a ServiceNow approval flow.

**Answer: A,C**

Explanation:

A playbook REST API action allows the administrator to send an HTTP request to a specified endpoint, such as the Prism Central API, to perform an operation, such as deleting a VM. A playbook webhook action allows the administrator to send a payload to a specified URL, such as a ServiceNow webhook, to trigger an event, such as an approval flow. Both of these actions can be used to automate the deletion of VMs from a ServiceNow approval flow, where the developers can request and confirm the removal of their environments.

A playbook webhook trigger and a playbook REST API trigger are not valid options, as they are used to initiate a playbook based on an external event, not to perform an action within a playbook. ### NEW QUESTION # 36

A developer is building a Blueprint that deploys a Redhat Enterprise Linux VM on vSphere. During the testing of the Blueprint to prepare it for users, it is discovered that the App deployment fails with the error.

What is the cause of this errors?

- A. Open-vm-tools is not installed or not started.
- B. vCenter Server cannot be reached.
- C. Cloud-init is not correctly formatted.
- D. The rhel7 template is unavailable for the VM deployment.

**Answer: A**

Explanation:

The error message indicates that customization of the guest operating system is not supported. This issue often arises because open-vm-tools is not installed or not running on the Redhat Enterprise Linux VM.

open-vm-tools is necessary for vSphere to perform guest customization tasks, such as setting the hostname, IP configuration, and other initialization tasks.

References:

- \* Nutanix documentation on Guest Customization Requirements.
- \* VMware documentation on Installing Open VM Tools.

### NEW QUESTION # 37

During the deployment of a multi-step Blueprint, a failure is encountered. The administrator corrected the failed step and saved the Blueprint.

What should the administrator do next?

- A. Delete the failed application and Launch a new application.
- B. Upon clicking Save the Blueprint task will be retried automatically.
- C. Use Continue in the failed application to retry.
- D. Soft Delete the failed application and Launch a new application.

**Answer: C**

Explanation:

If a Blueprint deployment fails, the administrator can use the Continue option in the Self-Service Portal to resume the deployment from the point of failure. This option will retry the failed task and continue with the remaining tasks in the Blueprint. The administrator does not need to delete the application or launch a new one, as this would waste time and resources. Saving the Blueprint will not automatically retry the task, as the Blueprint is only a template for the deployment.
