## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q307-Q312):

### NEW QUESTION # 307

Question:

A company recently migrated a large amount of research data to an Amazon S3 bucket. The company needs an automated solution to identify sensitive data in the bucket. A security team also needs to monitor access patterns for the data 24 hours a day, 7 days a week to identify suspicious activities or evidence of tampering with security controls.

Options:

- A. Set up an Amazon S3 Inventory report. Use Amazon Athena and Amazon QuickSight to identify sensitive data. Create a dashboard for the security team to review findings.
- **B. Enable Amazon Macie and Amazon GuardDuty on the account. Grant the security team access to Macie and GuardDuty. Review the findings with the security team.**
- C. Set up AWS CloudTrail reporting, and grant the security team read-only access to the CloudTrail reports. Set up an Amazon S3 Inventory report to identify sensitive data. Review the findings with the security team.
- D. Use AWS Identity and Access Management (IAM) Access Advisor to monitor for suspicious activity and tampering. Create a dashboard for the security team. Set up an Amazon S3 Inventory report to identify sensitive data. Review the findings with the security team.

**Answer: B**

Explanation:

To automatically identify sensitive data in Amazon S3 and monitor access patterns for suspicious activities:

\* Amazon Macie uses machine learning and pattern matching to discover and protect sensitive data in S3. It provides visibility into data security risks and enables automated protection against those risks.

\* Amazon GuardDuty is a threat detection service that continuously monitors for malicious activity and unauthorized behavior to protect AWS accounts and workloads. It analyzes events from AWS CloudTrail, VPC Flow Logs, and DNS logs.

By enabling both services, the company can automate the discovery of sensitive data and continuously monitor access patterns for potential security threats.

### NEW QUESTION # 308

A company is planning to run an AI/ML workload on AWS. The company needs to train a model on a dataset that is in Amazon S3 Standard. A model training application requires multiple compute nodes and single-digit millisecond access to the data.

Which solution will meet these requirements in the MOST cost-effective way?

- A. Move the data to a General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume attached to an Amazon EC2 instance. Point the model training application to the gp3 volume as the data source.
- **B. Move the data to S3 Express One Zone. Point the model training application to S3 Express One Zone as the data source.**
- C. Move the data to S3 Intelligent-Tiering. Point the model training application to S3 Intelligent-Tiering as the data source.
- D. Add partitions to the S3 bucket by adding random prefixes. Reconfigure the model training application to point to the new prefixes as the data source.

**Answer: B**

Explanation:

Amazon S3 Express One Zone provides single-digit millisecond latency and high throughput, making it ideal for ML workloads that require multiple compute nodes and fast access. It is also more cost-effective than traditional file or block storage for temporary, high-speed needs.

### NEW QUESTION # 309

An ecommerce company is experiencing an increase in user traffic. The company's store is deployed on Amazon EC2 instances as a two-tier two application consisting of a web tier and a separate database tier. As traffic increases, the company notices that the architecture is causing significant delays in sending timely marketing and order confirmation email to users. The company wants to reduce the time it spends resolving complex email delivery issues and minimize operational overhead.

What should a solutions architect do to meet these requirements?

- A. Create a separate application tier using EC2 instances dedicated to email processing. Place the instances in an Auto Scaling group.
- **B. Configure the web instance to send email through Amazon Simple Email Service (Amazon SES).**
- C. Create a separate application tier using EC2 instances dedicated to email processing.
- D. Configure the web instance to send email through Amazon Simple Notification Service (Amazon SNS).

**Answer: B**

### NEW QUESTION # 310

Your company has been storing a lot of data in Amazon Glacier and has asked for an inventory of what is in there exactly. So you have decided that you need to download a vault inventory. Which of the following statements is incorrect in relation to Vault Operations in Amazon Glacier?

- A. A vault inventory refers to the list of archives in a vault.
- B. You can use Amazon Simple Notification Service (Amazon SNS) notifications to notify you when the job completes.
- **C. You can use Amazon Simple Queue Service (Amazon SQS) notifications to notify you when the job completes.**
- D. Downloading a vault inventory is an asynchronous operation.

**Answer: C**

Explanation:

Amazon Glacier supports various vault operations.

A vault inventory refers to the list of archives in a vault. For each archive in the list, the inventory provides archive information such as archive ID, creation date, and size. Amazon Glacier updates the vault inventory approximately once a day, starting on the day the first archive is uploaded to the vault. A vault inventory must exist for you to be able to download it.

Downloading a vault inventory is an asynchronous operation. You must first initiate a job to download the inventory. After receiving the job request, Amazon Glacier prepares your inventory for download. After the job completes, you can download the inventory data.

Given the asynchronous nature of the job, you can use Amazon Simple Notification Service (Amazon SNS) notifications to notify you when the job completes. You can specify an Amazon SNS topic for each individual job request or configure your vault to send a notification when specific vault events occur.

Amazon Glacier prepares an inventory for each vault periodically, every 24 hours. If there have been no archive additions or deletions to the vault since the last inventory, the inventory date is not updated. When you initiate a job for a vault inventory, Amazon Glacier returns the last inventory it generated, which is a point-in-time snapshot and not real-time data. You might not find it useful to retrieve vault inventory for each archive upload. However, suppose you maintain a database on the client-side associating metadata about the archives you upload to Amazon Glacier. Then, you might find the vault inventory useful to reconcile information in your database with the actual vault inventory.

- **B. Search CloudTrail logs with Amazon Athena queries to identify the errors**
