ISTQB-CTFL Dumps Download & Exam Vce ISTQB-CTFL Free

The receptiveness of three novel relationships for ISTQB ISTQB-CTFL exam licenses clients to rehearse themselves in various conditions. Free demos are accessible for download to look at in work areas for ISTQB Certified Tester Foundation Level (CTFL v4.0) (ISTQB-CTFL) Exam. ISTQB ISTQB-CTFL Dumps awards you the whole day, constant client affiliation, and 365 days of free updates.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q265-Q270):

NEW QUESTION # 265

Why should you choose a test technique?

- A. Because you need to match the way you test to the content of the product under test
- B. Because this way you cover the full scope of the product's functionality
- C. Because choosing a test technique is a common practice in software testing
- D. Because of the time constraints that usually accompany a test project

Answer: A

Explanation:

You should choose a test technique because you need to match the way you test to the content of the product under test. A test technique is a method or process for deriving and selecting test cases based on some criteria or rules. Different test techniques are suitable for different types of software products, depending on their characteristics, functionalities, requirements, specifications, risks, etc. Choosing a test technique helps to ensure that the test cases are relevant, effective, and efficient for the product under test. The other options are not correct reasons to choose a test technique. Time constraints are not a factor for choosing a test technique, but rather for prioritizing or optimizing testing activities. Covering the full scope of the product's functionality is not a guarantee of choosing a test technique, but rather a goal of testing. Choosing a test technique is not a common practice in software testing, but rather a professional skill and responsibility.

NEW QUESTION # 266

Which of the following provides the BEST description of statement coverage?

- A. A black-box test technique which uses a state table to derive test cases
- B. A white-box test technique which covers the decision results which determine the next statement to be executed
- C. An experience-based test technique in which test cases are based on the tester's knowledge of past failures
- **D. A white-box test technique which focuses on the percentage of executable statements that has been executed by a test suite**

Answer: D

Explanation:

Statement coverage is a white-box test technique which focuses on executing all possible statements in the code at least once during testing. This helps in determining the percentage of executable statements that have been executed by the test suite, aiming to ensure that all parts of the program have been tested at least once (ISTQB Main Web).References:

NEW QUESTION # 267

Which ONE of the following options CORRECTLY describes one of the seven principles of the testing process?

- A. Automated testing enables exhaustive testing.
- B. The objective of testing is to implement exhaustive testing and execute as many test cases as possible.
- C. Exhaustive testing can only be carried out using behavior-based techniques.
- **D. It is impossible to test all possible combinations of inputs and preconditions of a system.**

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Exhaustive testing (testing all input combinations) is practically impossible except in trivial cases (C). Instead, testers focus on risk-based, prioritized, and efficient test techniques. The seven principles of testing in the ISTQB syllabus highlight that exhaustive testing is infeasible, and therefore, techniques such as equivalence partitioning, boundary value analysis, and risk-based testing are used to optimize test coverage.

NEW QUESTION # 268

Which of the following is a function of a dynamic analysis tool?

- A. Execute programs step-by-step in order to reproduce failures and find corresponding defects
- B. Provide support for release of baselines consisting of configuration items
- **C. Monitor the allocation, use and de-allocation of memory during run-time of a program**
- D. Provide support for traceability of tests, test results and incidents to source documents

Answer: C

Explanation:

A dynamic analysis tool is a tool that performs analysis of a software product based on its behavior during execution. A dynamic analysis tool can monitor various aspects of a program's run-time performance, such as memory usage, CPU load, response time, or

resource leaks. A dynamic analysis tool can monitor the allocation, use and de-allocation of memory during run-time of a program, which can help detect defects such as memory leaks, buffer overflows, or memory corruption. A dynamic analysis tool cannot provide support for traceability of tests, test results and incidents to source documents, as this is a function of a test management tool. A dynamic analysis tool cannot execute programs step-by-step in order to reproduce failures and find corresponding defects, as this is a function of a debugging tool. A dynamic analysis tool cannot provide support for release of baselines consisting of configuration items, as this is a function of a configuration management tool. NEW QUESTION # 269

What is 'Component Testing'?

- A. Functional testing
- B. Integration Testing
- C. Experience-based testing
- **D. A test level**

Answer: D

Explanation:

Component testing is a test level. A test level is a group of test activities that are organized and managed together based on some common characteristics or objectives. A test level can be defined based on various factors, such as the scope and target of testing, the phase and model of development, the stakeholders and roles involved in testing, etc. Component testing (also known as unit testing or module testing) is a test level that focuses on verifying the functionality and quality of individual software components (such as modules, classes, functions, methods, etc.). Component testing can be performed by developers or testers using various techniques and tools depending on the type and complexity of the components. The other options are not test levels. Integration testing is another test level that focuses on verifying the functionality and quality of groups of software components that interact with each other or with external systems. Functional testing is a type of black-box dynamic testing that verifies that the system under test performs its intended functions according to its requirements or specifications. Experience-based testing is a category of test design techniques that rely on the tester's knowledge and intuition to derive and select test cases based on their experience with similar systems, technologies, domains, risks, etc. Verified References: A Study Guide to the ISTQB Foundation Level 2018 Syllabus - Springer, page 19.

NEW QUESTION # 270

.....

Our company has employed a lot of excellent experts and professors in the field in the past years, in order to design the best and most suitable ISTQB-CTFL study materials for all customers. More importantly, it is evident to all that the ISTQB-CTFL Study Materials from our company have a high quality, and we can make sure that the quality of our products will be higher than other study materials in the market.
