**Highly-Praised 156-315.81 Qualification Test Helps You Pass the Check Point Certified Security Expert R81 Exam - PDFDumps**

Many customers want to check the content and quality of our 156-315.81 exam braindumps. So we developed trial versions for you. After you have used a trial version, you will have an overview of the content of the 156-315.81 simulating exam. This is enough to convince you that this is a product with high quality. If you are sure that you want this product, but we are not sure which version to buy, we can let you try multiple versions of 156-315.81 learning guide. And there are three varied versions on our website.

## CheckPoint Check Point Certified Security Expert R81 Sample Questions (Q204-Q209):

### NEW QUESTION # 204

You have created a rule at the top of your Rule Base to permit Guest Wireless access to the Internet. However, when guest users attempt to reach the Internet, they are not seeing the splash page to accept your Terms of Service, and cannot access the Internet. How can you fix this?

No.	Hits	Name	Source	Destination	VPN	Services & Applications	Action	Track
1	0	Guest Access	GuestUsers	* Any	* Any	* Any	Accept	Log

- A. On the Security Management Server object, check the box 'Identity Logging'.
- B. On the firewall object, Legacy Authentication screen, check 'Enable Identity Captive Portal'.
- **C. Right click Accept in the rule, select "More", and then check 'Enable Identity Captive Portal'.**
- D. In the Captive Portal screen of Global Properties, check 'Enable Identity Captive Portal'.

**Answer: C**

Explanation:

Explanation

The correct way to enable Identity Captive Portal for a specific rule is to right click Accept in the rule, select "More", and then check 'Enable Identity Captive Portal'. This will allow guest users to see the splash page and accept the Terms of Service before accessing the Internet. Identity Captive Portal is a feature that enables identity awareness for guest users who are not authenticated by other methods, such as Active Directory or Identity Agent. Identity Captive Portal can be enabled globally or per rule, depending on the security policy requirements.

### NEW QUESTION # 205

Which of the following is NOT a VPN routing option available in a star community?

- A. To center and to other satellites through center.
- B. To center, or through the center to other satellites, to Internet and other VPN targets.
- **C. To center only.**
- **D. To satellites through center only.**

**Answer: C,D**

Explanation:

Explanation

A star community is a VPN topology where one or more satellites connect to a center gateway. The center gateway can be a Security Gateway or a Security Management Server. The VPN routing option determines how the traffic is routed between the satellites and the center, and between the satellites themselves. There are three VPN routing options available in a star community:  
 To center only: The satellites can only communicate with the center gateway, and not with each other or with any other VPN targets. This option is useful for remote access clients that only need to access resources on the center gateway.

To center, or through the center to other satellites, to Internet and other VPN targets: The satellites can communicate with the center gateway, and also with other satellites, Internet hosts, and other VPN targets through the center gateway. This option is useful for branch offices that need to access resources on the center gateway, as well as on other branch offices, Internet hosts, and other VPN targets.

To center and to other satellites through center: The satellites can communicate with the center gateway, and also with other satellites through the center gateway. However, they cannot communicate with Internet hosts or other VPN targets. This option is useful for branch offices that need to access resources on the center gateway and on other branch offices, but not on Internet hosts or other VPN targets.

Therefore, the options A (To satellites through center only) and D (To center only) are not valid VPN routing options in a star community.

### NEW QUESTION # 206

What are the methods of SandBlast Threat Emulation deployment?

- A. Cloud, OpenServer and Vmware
- **B. Cloud, Appliance and Private**
- C. Cloud, Appliance and Hybrid
- D. Cloud, Smart-1 and Hybrid

**Answer: B**

Explanation:

Explanation

The methods of SandBlast Threat Emulation deployment are Cloud, Appliance, and Private. SandBlast Threat Emulation is a solution that detects and prevents zero-day attacks by emulating files in a sandbox environment and analyzing their behavior for malicious indicators. SandBlast Threat Emulation can be deployed in three different methods: Cloud, Appliance, and Private. Cloud method is when the files are sent to the Check Point cloud service for emulation and analysis. This method does not require any additional hardware or software on the customer's side, and provides the fastest updates and feeds from ThreatCloud. Appliance method is when the files are sent to a dedicated appliance on the customer's network for emulation and analysis. This method provides more control and privacy for the customer, and supports more file types and sizes. Private method is when the files are sent to a private cloud service on the customer's network for emulation and analysis. This method provides the highest level of control and privacy for the customer, and supports customizing the emulation environment and scenarios.

### NEW QUESTION # 207

With Mobile Access enabled, administrators select the web-based and native applications that can be accessed by remote users and define the actions that users can perform the applications. Mobile Access encrypts all traffic using:

- **A. HTTPS for web-based applications and 3DES or RC4 algorithm for native applications. For end users to access the native applications, they need to install the SSL Network Extender.**
- B. HTTPS for web-based applications and AES or RSA algorithm for native applications. For end users to access the native application, they need to install the SSL Network Extender.
- C. HTTPS for web-based applications and 3DES or RC4 algorithm for native applications. For end users to access the native applications, no additional software is required.
- D. HTTPS for web-based applications and AES or RSA algorithm for native applications. For end users to access the native application, no additional software is required.

**Answer: A**

### NEW QUESTION # 208

The Firewall kernel is replicated multiple times, therefore:

- **A. The Firewall can run the same policy on all cores.**
- B. The Firewall can run different policies per core
- C. The Firewall kernel only touches the packet if the connection is accelerated
- D. The Firewall kernel is replicated only with new connections and deletes itself once the connection times out

**Answer: A**

Explanation:

On a Security Gateway with CoreXL enabled, the Firewall kernel is replicated multiple times. Each replicated copy, or instance, runs on one processing core. These instances handle traffic concurrently, and each instance is a complete and independent inspection kernel. When CoreXL is enabled, all the kernel instances in the Security Gateway process traffic through the same interfaces and apply the same security policy.
