After using our Professional-Cloud-Security-Engineer learning materials, you will find that things that have been difficult before have become simple. Of course, that's because you are better. Opportunities are for those who are prepared. And our Professional-Cloud-Security-Engineer exam questions are the right tool to help you get prepared. With the most up-to-date knowledge and information of the Professional-Cloud-Security-Engineer Practice Braindumps, you can be capable to deal with all of the conditions in your job. Believe it, good people will be better!

3. Security in Google Cloud

This is the last course that candidates should go through to prepare for the Google Professional Cloud Security Engineer exam. This training covers the security controls on Google Cloud from a wider perspective. The domains addressed here include the mitigation techniques used to manage attacks at different points within a Google-centered infrastructure. These include phishing attacks, threats associated with content use or classification, and the distributed denial-of-service (DDoS).

Google Professional-Cloud-Security-Engineer Exam is a certification test that validates a candidate's knowledge and skills in securing applications, data, and infrastructure on the Google Cloud Platform (GCP). Professional-Cloud-Security-Engineer exam is designed for security professionals who want to demonstrate their expertise in implementing security solutions on the GCP. Google Cloud Certified - Professional Cloud Security Engineer Exam certification is one of the most prestigious in the industry, making it an essential qualification for anyone seeking a career in cloud security.

Latest Professional-Cloud-Security-Engineer Mock Test & Professional-Cloud-Security-Engineer Valid Dumps Ebook

Our Google Professional-Cloud-Security-Engineer qualification test help improve your technical skills and more importantly, helping you build up confidence to fight for a bright future in tough working environment. Our professional experts devote plenty of time and energy to developing the Professional-Cloud-Security-Engineer Study Tool. You can trust us and let us be your honest cooperators in your future development. Here are several advantages about our Google Professional-Cloud-Security-Engineer exam for your reference.

Google Professional-Cloud-Security-Engineer Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Manages a secure infrastructure leveraging Google security technologies
Topic 2	<ul style="list-style-type: none">Understanding of security best practices and industry security requirements
Topic 3	<ul style="list-style-type: none">Design and Implement a secure infrastructure on Google Cloud Platform
Topic 4	<ul style="list-style-type: none">All aspects of Cloud Secur

Google Cloud Certified - Professional Cloud Security Engineer Exam Sample Questions (Q54-Q59):

NEW QUESTION # 54

Your company has been creating users manually in Cloud Identity to provide access to Google Cloud resources. Due to continued growth of the environment, you want to authorize the Google Cloud Directory Sync (GCDS) instance and integrate it with your on-premises LDAP server to onboard hundreds of users. You are required to:

- Replicate user and group lifecycle changes from the on-premises LDAP server in Cloud Identity.
- Disable any manually created users in Cloud Identity.

You have already configured the LDAP search attributes to include the users and security groups in scope for Google Cloud. What should you do next to complete this solution?

- A. 1. Configure the option to delete domain users not found in LDAP. 2. Run GCDS after user and group lifecycle changes.
- B. 1. Configure the option to suspend domain users not found in LDAP. 2. Set up a recurring GCDS task.**
- C. 1. Configure the LDAP search attributes to exclude manually created Cloud Identity users not found in LDAP. 2. Run GCDS after user and group lifecycle changes.
- D. 1. Configure the LDAP search attributes to exclude manually created Cloud Identity users not found in LDAP. 2. Set up a recurring GCDS task.

Answer: B

Explanation:

To achieve the requirement "Disable any manually created users in Cloud Identity", configure GCDS to suspend rather than delete accounts if user accounts are not found in the LDAP directory in GCDS.

NEW QUESTION # 55

You are migrating an application into the cloud. The application will need to read data from a Cloud Storage bucket. Due to local regulatory requirements, you need to hold the key material used for encryption fully under your control and you require a valid rationale for accessing the key material.

What should you do?

- A. Encrypt the data in the Cloud Storage bucket by using Customer Managed Encryption Keys. Configure an IAM deny

policy for unauthorized groups

- B. Generate a key in your on-premises environment to encrypt the data before you upload the data to the Cloud Storage bucket Upload the key to the Cloud Key ManagementService (KMS). Activate Key Access Justifications (KAJ) and have the external key system reject unauthorized accesses.
- C. Generate a key in your on-premises environment and store it in a Hardware Security Module (HSM) that is managed on-premises Use this key as an external key in the Cloud Key Management Service (KMS). Activate Key Access Justifications (KAJ) and set the external key system to reject unauthorized accesses.
- D. Encrypt the data in the Cloud Storage bucket by using Customer Managed Encryption Keys backed by a Cloud Hardware Security Module (HSM). Enable data access logs.

Answer: C

Explanation:

Explanation

By generating a key in your on-premises environment and storing it in an HSM that you manage, you're ensuring that the key material is fully under your control. Using the key as an external key in Cloud KMS allows you to use the key with Google Cloud services without having the key stored on Google Cloud.

Activating Key Access Justifications (KAJ) provides a reason every time the key is accessed, and you can configure the external key system to reject unauthorized access attempts.

NEW QUESTION # 56

A customer's internal security team must manage its own encryption keys for encrypting data on Cloud Storage and decides to use customer-supplied encryption keys (CSEK).

How should the team complete this task?

- A. Use the gsutil command line tool to upload the object to Cloud Storage, and specify the location of the encryption key.
- B. Generate an encryption key in the Google Cloud Platform Console, and upload an object to Cloud Storage using the specified key.
- C. Upload the encryption key to a Cloud Storage bucket, and then upload the object to the same bucket.
- D. Encrypt the object, then use the gsutil command line tool or the Google Cloud Platform Console to upload the object to Cloud Storage.

Answer: D

Explanation:

NEW QUESTION # 57

A company is backing up application logs to a Cloud Storage bucket shared with both analysts and the administrator. Analysts should only have access to logs that do not contain any personally identifiable information (PII). Log files containing PII should be stored in another bucket that is only accessible by the administrator.

What should you do?

- A. Use Cloud Pub/Sub and Cloud Functions to trigger a Data Loss Prevention scan every time a file is uploaded to the shared bucket. If the scan detects PII, have the function move into a Cloud Storage bucket only accessible by the administrator.
- B. On the bucket shared with both the analysts and the administrator, configure Object Lifecycle Management to delete objects that contain any PII.
- C. On the bucket shared with both the analysts and the administrator, configure a Cloud Storage Trigger that is only triggered when PII data is uploaded. Use Cloud Functions to capture the trigger and delete such files.
- D. Upload the logs to both the shared bucket and the bucket only accessible by the administrator. Create a job trigger using the Cloud Data Loss Prevention API. Configure the trigger to delete any files from the shared bucket that contain PII.

Answer: A

NEW QUESTION # 58

An organization is starting to move its infrastructure from its on-premises environment to Google Cloud Platform (GCP). The first step the organization wants to take is to migrate its current data backup and disaster recovery solutions to GCP for later analysis. The organization's production environment will remain on-premises for an indefinite time. The organization wants a scalable and cost-efficient solution.

Which GCP solution should the organization use?

- A. Cloud Storage using a scheduled task and gsutil
- B. Cloud Datastore using regularly scheduled batch upload jobs
- C. BigQuery using a data pipeline job with continuous updates
- D. Compute Engine Virtual Machines using Persistent Disk

Answer: C
