Amazon SAA-C03 Exam is designed for IT professionals who want to become certified in Amazon Web Services (AWS) solutions architecture. It is the latest version of the AWS Certified Solutions Architect - Associate certification, which has been updated to include the latest AWS services and features. AWS Certified Solutions Architect - Associate certification is intended for individuals who are interested in designing and deploying scalable, highly available, and fault-tolerant systems on AWS.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q40-Q45):

NEW QUESTION # 40

An ecommerce company is running a seasonal online sale. The company hosts its website on Amazon EC2 instances spanning multiple Availability Zones. The company wants its website to manage sudden traffic increases during the sale. Which solution will meet these requirements MOST cost-effectively?

- A. Configure an Auto Scaling group to scale out as traffic increases. Create a launch template to start new instances from a preconfigured Amazon Machine Image (AMI).
- B. Create an Auto Scaling group for the website. Set the minimum size of the Auto Scaling group so that it can handle high traffic volumes without the need to scale out.
- C. Create an Auto Scaling group that is large enough to handle peak traffic load. Stop half of the Amazon EC2 instances. Configure the Auto Scaling group to use the stopped instances to scale out when traffic increases.
- D. Use Amazon CloudFront and Amazon ElastiCache to cache dynamic content with an Auto Scaling group set as the origin. Configure the Auto Scaling group with the instances necessary to populate CloudFront and ElastiCache. Scale in after the cache is fully populated.

Answer: A

Explanation:

The solution that meets the requirements of high availability, resiliency, and minimal operational effort is to use AWS Transfer for SFTP and an Amazon S3 bucket for storage. This solution allows the company to securely transfer files over SFTP to Amazon S3, which is a durable and scalable object storage service. The company can then modify the application to pull the batch files from Amazon S3 to an Amazon EC2 instance for processing. The EC2 instance can be part of an Auto Scaling group with a scheduled scaling policy to run the batch operation only at night. This way, the company can save costs by scaling down the EC2 instances when they are not needed. The other solutions do not meet all the requirements because they either use Amazon EFS or Amazon EBS for storage, which are more expensive and less scalable than Amazon S3, or they do not use a scheduled scaling policy to optimize the EC2 instances usage. NEW QUESTION # 41

A media company has a multi-account AWS environment in the us-east-1 Region. The company has an Amazon Simple Notification Service (Amazon SNS) topic in a production account that publishes performance metrics. The company has an AWS Lambda function in an administrator account to process and analyze log data.

The Lambda function that is in the administrator account must be invoked by messages from the SNS topic that is in the production account when significant metrics tM* reported.

Which combination of steps will meet these requirements? (Select TWO.)

- A. Create an IAM resource policy for the Lambda function that allows Amazon SNS to invoke the function. Implement an Amazon Simple Queue Service (Amazon SQS) queue in the administrator account to buffer messages from the SNS topic that is in the production account. Configure the SOS queue to invoke the Lambda function.
- B. Create an IAM policy for the SNS topic that allows the Lambda function to subscribe to the topic.
- C. Use an Amazon EventBridge rule in the production account to capture the SNS topic notifications. Configure the EventBridge rule to forward notifications to the Lambda function that is in the administrator account.
- D. Store performance metrics in an Amazon S3 bucket in the production account. Use Amazon Athena to analyze the metrics from the administrator account.

Answer: A,B

Explanation:

* Requirement Analysis: The Lambda function in the administrator account needs to process messages from an SNS topic in the production account.

* IAM Policy for SNS Topic: Allows the Lambda function to subscribe and be invoked by the SNS topic.

* SQS Queue for Buffering: Using an SQS queue provides reliable message delivery and buffering between SNS and Lambda, ensuring all messages are processed.

* Implementation:

* Create an SQS queue in the administrator account.

* Set an IAM policy to allow the Lambda function to subscribe to and be invoked by the SNS topic.

* Configure the SNS topic to send messages to the SQS queue.

* Set up the SQS queue to trigger the Lambda function.

* Conclusion: This solution ensures reliable message delivery and processing with appropriate permissions.

NEW QUESTION # 42

A company runs a web-based portal that provides users with global breaking news, local alerts, and weather updates. The portal delivers each user a personalized view by using mixture of static and dynamic content.

Content is served over HTTPS through an API server running on an Amazon EC2 instance behind an Application Load Balancer (ALB). The company wants the portal to provide this content to its users across the world as quickly as possible.

How should a solutions architect design the application to ensure the LEAST amount of latency for all users?

- **A. Deploy the application stack in a single AWS Region. Use Amazon CloudFront to serve all static and dynamic content by specifying the ALB as an origin.**
- B. Deploy the application stack in two AWS Regions. Use an Amazon Route 53 geolocation routing policy to serve all content from the ALB in the closest Region.
- C. Deploy the application stack in a single AWS Region. Use Amazon CloudFront to serve the static content. Serve the dynamic content directly from the ALB.
- D. Deploy the application stack in two AWS Regions. Use an Amazon Route 53 latency routing policy to serve all content from the ALB in the closest Region.

Answer: A

NEW QUESTION # 43

A company is building a web application. The company needs a load balancing solution that supports HTTPS header-based routing. The company's security team also requires a rules-based method of blocking specific incoming requests to decrease the effects of malicious activity.

Which solution will meet these requirements?

- A. Create an Application Load Balancer (ALB). Configure an HTTPS listener with mutual TLS enabled.
- B. Create an Application Load Balancer (ALB). Integrate the ALB with AWS Config. Apply custom rules to all ALB resources.
- C. Create a Network Load Balancer (NLB). Configure AWS Network Firewall with the security team's required rules.
- **D. Create an Application Load Balancer (ALB). Integrate the ALB with AWS WAF. Configure the security team's required rules.**

Answer: D

Explanation:

* Application Load Balancer (ALB) supports HTTP/HTTPS layer 7 routing, including header-based routing, path-based routing, and host-based routing.

- * AWS WAF is designed to provide rules-based filtering (block, allow, count) of HTTP(S) requests to protect applications from common exploits and malicious traffic.
 - * ALB integrates directly with AWS WAF, so you can attach a web ACL with custom rules defined by the security team to block specific patterns while still using header-based routing.
- Why the others are not correct:
- * A: Mutual TLS adds client certificate authentication but does not provide rules-based blocking or WAF- style inspection.
 - * C: AWS Config is for configuration compliance and auditing, not request filtering.
 - * D: NLB operates at layer 4 (TCP/UDP); it does not support HTTP header-based routing.

NEW QUESTION # 44

A company is planning to migrate a legacy application to AWS. The application currently uses NFS to communicate to an on-premises storage solution to store application data. The application cannot be modified to use any other communication protocols other than NFS for this purpose.

Which storage solution should a solutions architect recommend for use after the migration?

- **A. Amazon Elastic File System (Amazon EFS)**
- B. Amazon Elastic Block Store (Amazon EBS)
- C. Amazon EMR File System (Amazon EMRFS)
- D. AWS DataSync

Answer: A

Explanation:

Amazon Elastic File System (EFS) is the ideal solution for migrating legacy applications that require NFS (Network File System) communication. EFS provides fully managed, scalable NFS storage in the cloud, and it supports the standard NFS protocols, allowing the legacy application to continue using NFS without modification after migration to AWS.

Key AWS features:

NFS Support: EFS natively supports the NFSv4 protocol, which makes it the best solution for workloads that rely on NFS communication.

Scalability and Availability: EFS automatically scales as application demands grow, making it a highly available and reliable storage solution.

AWS Documentation: According to AWS's best practices for file storage, EFS is recommended for any workloads requiring NFS support in a cloud environment.
