

# CTAL-TAE Exam Test - 100% Pass CTAL-TAE: ISTQB Certified Tester Advanced Level, Test Automation Engineering First-grade Reliable Exam Papers

What's more, part of that BraindumpsPrep CTAL-TAE dumps now are free: <https://drive.google.com/open?id=18Mxg-iZMn7reoTq4TGklO3H35VSIFAwI>

Do you want to prove your ability in IT field? Do you want to get more recognition and employment opportunities? So CTAL-TAE exam certification will be an important evidence to prove yourself. Almost all those who are working in the IT field know how important to get CTAL-TAE exam certification. As we know, everyone's energy is limited, if you want to pass the important CTAL-TAE Certification Exam in such short time, the exam software provided by our BraindumpsPrep will be a good helper for your preparation for the exam. The complete questions and exam software created in accordance with the laws of the people's memory will help you succeed in the CTAL-TAE exam.

Preparing for the CTAL-TAE exam requires a combination of practical experience and theoretical knowledge. Candidates can benefit from taking training courses and using study materials provided by the ISTQB to gain a deeper understanding of the topics covered in the exam.

ISQI CTAL-TAE certification exam is an online, proctored exam that consists of multiple-choice questions. CTAL-TAE Exam Duration is 180 minutes, and the passing score is 65%. Candidates can take the exam in various languages such as English, German, French, and Spanish. CTAL-TAE exam fee varies depending on the location and country.

## Reliable ISQI CTAL-TAE Exam Papers & CTAL-TAE Braindump Pdf

ISQI CTAL-TAE learning materials are new but increasingly popular choices these days which incorporate the newest information and the most professional knowledge of the practice exam. All points of questions required are compiled into our ISTQB Certified Tester Advanced Level, Test Automation Engineering CTAL-TAE Preparation quiz by experts. By the way, the CTAL-TAE certificate is of great importance for your future and education.

ISQI CTAL-TAE Exam is an advanced level certification in the field of test automation engineering. ISTQB Certified Tester

Advanced Level, Test Automation Engineering certification is designed to test the candidate's knowledge and skills in the areas of automation testing, test automation frameworks, and automation tools. ISTQB Certified Tester Advanced Level, Test Automation Engineering certification is globally recognized and is ideal for individuals who want to establish themselves as experts in test automation engineering.

## ISQI ISTQB Certified Tester Advanced Level, Test Automation Engineering Sample Questions (Q32-Q37):

### NEW QUESTION # 32

(In User Acceptance Testing (UAT) for a new SUT, in addition to the manual tests performed by the end- users, automated tests are performed that focus on the execution of repetitive and routine test scenarios. In which of the following environments are all these tests typically performed?)

- A. Production environment
- **B. Preproduction environment**
- C. Integration environment
- D. Build environment

**Answer: B**

Explanation:

TAE distinguishes test environments by purpose and risk. User Acceptance Testing is typically performed in an environment that is as production-like as feasible (configuration, data shape, integrations) but still controlled and safe for testing activities. This is commonly referred to as preproduction (often "staging"): it supports realistic end-to-end flows, allows business users to validate that the SUT meets acceptance criteria, and enables running routine/repetitive automated checks without risking live operations. A build environment is focused on compiling/packaging and basic verification, not business acceptance. An integration environment is used to validate interactions among components/systems, but may not reflect full production- like configuration, and it's often shared and volatile-less suitable for formal acceptance activities involving end users. Production is generally avoided for UAT because acceptance testing can alter live data, disrupt users, and introduce unacceptable business risk; production testing is typically limited to tightly controlled smoke checks, monitoring, or specific "in-production" validation patterns with strong safeguards. Therefore, the environment in which both end-user manual UAT and supporting automated routine scenarios are typically executed is the preproduction environment, aligning with TAE's guidance on balancing realism with risk containment.

### NEW QUESTION # 33

Which of the following statement about the implementation of automated regression testing is FALSE?

- A. When automating regression tests, the initialization steps set the test preconditions should be automated wherever possible
- B. When automating regression tests, the corresponding manual tests should have already been executed to verify they operate correctly
- C. When automating regression tests, the structure of automated tests must always be the same as the corresponding manual tests
- **D. When automating regression tests, consideration should be given to how much time would be saved by automation**

**Answer: D**

### NEW QUESTION # 34

Consider a TAS that exclusively uses the APIs of a SUT. To make this work, significant changes have been required to the SUT by adding a set of dedicated test interfaces to the APIs. All the automated tests will use these test interfaces when interacting with the SUT. Assume that you are currently verifying the correctness of the automated test environment and test tool setup. Which of the following would you expect to be the MOST specific risk associated with this scenario?

- **A. The connectivity from the TAS to the dedicated test interfaces will not work**
- B. The process of configuring the TAS will be error-prone due to manual intervention
- C. False alarms, that are unlikely to occur in the real world, will be observed during testing
- D. The automated test cases will not contain the expected result

**Answer: A**

### NEW QUESTION # 35

Some automated regression test scripts run by a TAS in a given test environment make calls to private APIs that require authentication for all requests (the authentication method is the same for all APIs). The SUT is a business-critical system. The following two changes are planned: a change in the authentication method of all APIs and a minor upgrade of the OS (Operating System) in the test environment. You have updated the test scripts to cope with the change in the API authentication method. Which of the following sequences of activities is BEST to ensure that the test scripts are not adversely affected by these changes?

- A. Implement one change at a time and run a subset of the updated test scripts after each change
- **B. Implement one change at a time and run a subset of the updated test scripts after each change, and finally run all the updated test scripts**
- C. First implement the change in the API authentication method, then upgrade the OS, and finally run all the updated test scripts
- D. First upgrade the OS, then implement the change in the API authentication method, and finally run all the updated test scripts

**Answer: B**

Explanation:

TAE recommends controlled change management to isolate causes when multiple changes are introduced.

When you apply more than one change at once, diagnosing failures becomes harder because you cannot easily attribute effects to a specific change. The best practice is to implement changes incrementally, validating automation and system behavior after each change using a representative subset of tests (e.g., smoke/build verification or targeted regression) to quickly detect issues. Because the system is business-critical, risk mitigation is stronger: you want early detection and clear attribution. After each change is validated with a subset, you then execute the full updated regression suite to ensure overall coverage and confidence. Options A and C apply two changes before running tests, which reduces diagnostic clarity and increases the risk of late discovery. Option D describes incremental changes with subset testing but omits the final full-suite run, which TAE would recommend to ensure broad coverage after all changes have been applied. Therefore, the best sequence is: change one item, run a subset, repeat for the next change, then run all updated scripts.

### NEW QUESTION # 36

You are reviewing the testability of your SUT.

Which of the following BEST refers to the characteristic of OBSERVABILITY?

- **A. The ability of the SUT to perform its intended function for a specified period of time**
- B. The ability to exercise the SUT by entering inputs, triggering events and invoking methods
- C. The ability to identify states, outputs, intermediate result and error messages in the SUT
- D. The ability of the SUT to prevent unauthorized access to its components or data.

**Answer: A**

### NEW QUESTION # 37
