CompTIA Network+ Certification Exam Sample Questions (Q376-Q381):

NEW QUESTION # 376
A Chief Executive Officer (CEO) of a company purchases a new phone that will be used while traveling to different countries. The CEO needs to be able to place outgoing calls and receive incoming calls on the phone using a SIM card. Which of the following cellular technologies does the CEO's phone need?

- A. SLA
- B. GSM
- C. CDMA
- D. WDMA

Answer: B

Explanation:
GSM (Global System for Mobile communications) is the international standard that uses SIM cards to authenticate and connect phones to the cellular network. GSM allows users to place and receive calls while traveling globally, provided they have a SIM card. CDMA, on the other hand, does not use SIM cards in the same way and is primarily used in the United States.

NEW QUESTION # 377
Which of the following connectors allows a singular QSFP transceiver to have several physical connections?

- A. ST
- B. RJ45
- C. MPO
- D. LC

Answer: C

Explanation:

The MPO (Multi-fiber Push On) connector is designed to handle multiple fiber strands in a single connector, and it is commonly used with high-density transceivers like QSFP (Quad Small Form-factor Pluggable).

QSFP can support up to four channels (hence "quad"), and MPO connectors can interface multiple fibers (e.g.,

8, 12, 24), making them ideal for 40Gbps or 100Gbps deployments.

RJ45 (A) is used for Ethernet over copper.

ST (B) and LC (C) are single-fiber connectors - they don't support the multi-fiber needs of QSFP setups.

Therefore, MPO is the correct connector type for this use case.

NEW QUESTION # 378

A small company has the following IP addressing strategy:

A user is unable to connect to the company fileshare server located at 192.168.10.1. The user's networking configuration is:

Which of the following will most likely correct the issue?

- A. Changing the subnet mask to 255.255.255.0
- B. Changing the IPv4 address to 192.168.10.1
- C. Changing the physical address to 7A-01-7A-21-01-50
- D. Changing the DNS servers to internet IPs

Answer: A

Explanation:

If the user cannot communicate with 192.168.10.1, they might be on a different subnet. Changing the subnet mask to 255.255.255.0 ensures the user and the file server are in the same subnet.

Breakdown of Options:

A . Changing the IPv4 address to 192.168.10.1 - This would conflict with the server's IP.

B . Changing the subnet mask to 255.255.255.0 - ☐ Correct answer. Ensures both the user and the server are on the same subnet.

C . Changing the DNS servers - DNS does not affect local network connectivity.

D . Changing the physical address - The MAC address does not impact subnet communication.

NEW QUESTION # 379

A customer is adding fiber connectivity between adjacent buildings. A technician terminates the multimode cable to the fiber patch panel. After the technician connects the fiber patch cable, the indicator light does not turn on. Which of the following should a technician try first to troubleshoot this issue?

- A. Examine the cable runs for visual faults.
- B. Reverse the fibers.
- C. Verify the fiber size.
- D. Reterminate the fibers.

Answer: B

Explanation:

When working with fiber optic cables, one common issue is that the transmit (TX) and receive (RX) fibers might be reversed. The first step in troubleshooting should be to reverse the fibers at one end to ensure they are correctly aligned (TX to RX and RX to TX). This is a simple and quick step to rule out a common issue before moving on to more complex troubleshooting.References:CompTIA Network+ study materials.

NEW QUESTION # 380

After installing a series of Cat 8 keystones, a data center architect notices higher than normal interference during tests. Which of the following steps should the architect take to troubleshoot the issue?

- A. Connect the RX/TX wires to different pins.

- B. Use passthrough modular crimping plugs instead of traditional crimping plugs.
- C. Run a speed test on a device that can only achieve 100Mbps speeds.
- D. Check to see if the end connections were wrapped in copper tape before terminating.

Answer: D

Explanation:
* Importance of Proper Termination:
* Cat 8 cabling requires precise termination practices to ensure signal integrity and reduce interference. One common requirement is to wrap the end connections in copper tape to maintain shielding and reduce electromagnetic interference (EMI).
* Interference Troubleshooting:
* Interference in high-frequency cables like Cat 8 can be caused by improper shielding or grounding. Checking the end connections for proper wrapping in copper tape is a crucial step.
* Why Other Options are Less Likely:
* Passthrough modular crimping plugs: Not specifically related to interference issues and are typically used for ease of cable assembly.
* Connecting RX/TX wires to different pins: Would likely result in no connection or incorrect data transmission rather than interference.
* Running a speed test on a device that can only achieve 100Mbps speeds: This would not diagnose interference and would not provide relevant information for Cat 8 cabling rated for
* higher speeds.
* Corrective Actions:
* Verify that all end connections are properly wrapped with copper tape before termination.
* Ensure that the shielding is continuous and properly grounded throughout the installation.
* Retest the cabling for interference after making corrections.
