Acquia Drupal-Site-Builder認定テキスト & Drupal-Site-Builder ミュレーション問題

数年以来の整理と分析によって開発されたDrupal-Site-Builder問題集は権威的で全面的です。Drupal-Site-Builder問題集を利用して試験に合格できます。この問題集の合格率は高いので、多くのお客様からDrupal-Site-Builder問題集への好評をもらいました。Drupal-Site-Builder問題集のカバー率が高いので、勉強した問題は試験に出ることが多いです。だから、弊社の提供するDrupal-Site-Builder問題集を暗記すれば、きっと試験に合格できます。

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 認定 Drupal-Site-Builder 試験問題 (Q28-Q33):

質問 # 28

You are building a conference website. All attendees are required to submit an RSVP form. The submissions of the form should be emailed to the attendee and site administrator.

How will you build this functionality?

- A. Download and enable the RSVP module.
- B. Enable site-wide contact form, rename it to RSVP and configure email functionality in the form.
- **C. Create a new contact form type called RSVP and configure email functionality in the form.**
- D. Create a content type called RSVP with the required fields. Give the permission to create RSVP content to the attendee role.

正解: C

解説:

Drupal 10 and Drupal 11 include the Contact module in core, which allows administrators to create multiple contact form types . Each contact form can have its own configuration, including recipients and email notifications . According to Drupal documentation, you can create custom contact forms (e.g., RSVP) and configure them to send emails to specified recipients when a user submits the form

Option A is correct because creating a dedicated RSVP contact form allows you to configure email notifications to both the attendee (via auto-reply) and the site administrator. This approach uses Drupal core functionality and is the recommended way to handle simple form submissions with email notifications.

Option B is incorrect because content types are used for structured content, not form submissions with email handling. Option C is not ideal because the site-wide contact form is meant for general communication and does not provide flexibility for RSVP-specific workflows. Option D is unnecessary since Drupal core already provides the required functionality.

Thus, the best and documented solution is to create a custom contact form and configure its email settings, making A correct.

質問 # 29

Your content team needs to use < div > tags in the content of some articles. The default configuration does not allow for this.

How can you reconfigure the site to support this request? (Select 2 options)

- A. Enable the site theme's "structural HTML" setting.
- **B. Reconfigure the "Basic HTML" text format to allow the use of < div > tags.**
- **C. Reconfigure the page's body field to use the "Full HTML" text format.**
- D. Reconfigure the site's permissions; grant content editors the "Use advanced HTML" permission.

正解: B、C

質問 # 30

Recent log entries of your site show that there are too many failed login attempts for the site super admin user (user 1).

How can you better secure the Drupal super admin user (user 1) from outside attacks?

- **A. Do not give this user an obvious name like "admin" or "administrator" which are too easy to guess.**
- B. Only allow members of the Drupal community in good standing to be user 1.
- C. Cancel the user account for user 1.
- D. Remove the "Administrator" role from user 1, which makes them an anonymous user.

正解: A

解説:

Drupal's official security guidance for the super user account (user 1) specifically recommends that administrators do not name the first account "admin" or something obvious . The reason is straightforward: obvious usernames make brute-force and credential-guessing attacks easier, because attackers already know half of the login credentials they need to target. Drupal's administration and security documentation also recommends limiting direct use of user 1 and protecting it carefully because it is a uniquely powerful account.

That makes option D the correct answer. The other options do not match Drupal's documented best practices.

There is no Drupal security rule about "members of the Drupal community in good standing" being allowed to use user 1. Canceling the user 1 account is not the recommended solution for this situation, and removing the Administrator role from user 1 would not make the account anonymous; in Drupal, user 1 is a special account with superuser behavior that is handled separately from ordinary role assignment. Drupal's own guidance emphasizes safer naming and tighter handling of the account, not these alternative actions.

質問 # 31

You have created a new Article node with a title, an image and a body field. Your site is configured to use Drupal's core search. If you search for a phrase which is used in your new article, the article is not returned in the search results. Search is otherwise working correctly.

Why is your article not appearing in the search results?

- A. Drupal core search does not work very well, and you should use a contributed module for search instead.
- **B. Cron has not run since you added the article, so Drupal has not indexed the new article yet.**
- C. The core search module must be configured to recognize the search term.
- D. You did not check the "Add to search index" checkbox when creating your article.

正解: B

解説:

Drupal core search does not index newly created or updated content immediately in the default workflow.

According to the official Drupal core Search module overview, content actions such as creating, editing, or deleting content automatically mark the affected content items for indexing or reindexing at the next cron run

. Until cron runs, the new or changed content is not updated in the search index, so a newly created article may not appear in search results even though search is otherwise functioning correctly.

This makes option C the correct answer. The other options do not match Drupal core behavior. There is no normal site-building step where you configure core search to "recognize" a specific term, and Drupal does not provide an "Add to search index" checkbox when creating an article in core search. Also, while contributed search solutions exist, the question states that Drupal core search is already working correctly, so the missing result is best explained by indexing timing, not by a flaw requiring another module. Drupal's search documentation is explicit that cron is responsible for updating the index after content changes.

質問 # 32

You have a content type "Places" which lists tourist destinations of different countries. You would like the visitors to be able to mark their country while commenting on "Places". This does not apply to other content types.

How will you build this functionality?

- A. Use the GeoIP module to tag users with their locations.
- B. Obtain country information from the user profile field while adding comments.
- **C. Create a new comment type with a new field "Country" and associate it with Places content type.**
- D. Create a "Country" vocabulary and add a term reference field to "Places" content type.

正解: C

解説:

Drupal's Comment module supports creating different comment types and attaching them to content entities.

The official Comment module documentation states that Drupal can create new comment types that can be attached to content entities, and the detailed comment documentation explains that when you create a comment type and choose the target entity type as Content, that comment type becomes available when adding a comment field to a content type.

Drupal's field documentation also explains that fields on comments are defined at the content-type level, on the Comment fields tab of the content type edit page. When you add a field for comments, each comment on content items of that type gets that field. Drupal even gives an example of adding a field to comments for one content type but not another, which matches this requirement exactly.

So the right solution is to create a new comment type for Places comments, add a Country field to that comment type, and then use that comment type on the Places content type only. The other options either store the data in the wrong place or do not make it specific to comments on Places.
