NEW QUESTION # 503

During periods of warehouse contention which parameter controls the maximum length of time a warehouse will hold a query for processing?

- A. QUERY_TIMEOUT_IN_SECONDS
- B. STATEMENT_TIMEOUT_IN_SECONDS
- C. STATEMENT_QUEUED_TIMEOUT_IN_SECONDS
- D. MAX_CONCURRENCY_LEVEL

Answer: C

Explanation:

The parameter STATEMENT_QUEUED_TIMEOUT_IN_SECONDS sets the limit for a query to wait in the queue in order to get its chance of running on the warehouse. The query will quit after reaching this limit.

By default, the value of this parameter is 0 which means the queries will wait indefinitely in the waiting queue

NEW QUESTION # 505

A JSON document is stored in the source_column of type VARIANT. The document has an array called elements. The array contains the name key that has a string value. How can a Snowflake user extract the name from the first element?

- A. Source_column.element[0].name
- **B. Source_column.element[1].name**
- C. Source_column.element[0].name
- D. Source_column.element[1].name

Answer: B

Explanation:

In Snowflake, when dealing with semi-structured data such as a JSON document stored in a VARIANT column, the proper syntax to extract a value is to use the column name followed by the path to the specific element. Since arrays in JSON are zero-indexed, the first element is referenced with [0]. Therefore, to extract the name from the first element of the elements array, the correct syntax is Source_column.elements[0].

name.
