CrowdStrike Certified Cloud Specialist Sample Questions (Q142-Q147):

NEW QUESTION # 142

What cloud-conscious attacker behavior is used to allow them to stay hidden in the environment?

- A. Certificate added to an application registration
- B. EC2 Default security group does not block all traffic
- C. Storage Account Networking changed to All Networks
- **D. CloudTrail logging disabled**

Answer: D

Explanation:

A common cloud-conscious attacker technique used to remain hidden in a compromised environment is disabling CloudTrail logging. AWS CloudTrail records API activity across an account, providing critical visibility into actions taken by users, roles, and services. By disabling or tampering with CloudTrail, attackers significantly reduce the likelihood of detection.

CrowdStrike Falcon Cloud Security classifies this behavior as a high-risk indicator because it directly impacts monitoring, forensics, and incident response. Without CloudTrail logs, security teams lose audit trails that are essential for identifying malicious actions such as privilege escalation, data exfiltration, or persistence mechanisms.

Other options represent misconfigurations or changes that may increase exposure but do not directly suppress visibility. For example, modifying storage networking or security groups increases attack surface, while adding certificates may support persistence-but none are as directly linked to stealth as disabling logging.

Therefore, CloudTrail logging disabled is the correct answer and a well-documented cloud attack tactic used to evade detection.

NEW QUESTION # 143

What is the primary purpose of editing a cloud security posture policy in the Falcon platform?

- **A. To define compliance benchmarks and enforce them across cloud environments.**
- B. To disable logging for high-volume cloud services to save costs.
- C. To deploy endpoint agents on unmanaged devices in the cloud.
- D. To configure runtime protection for containers in Kubernetes clusters.

Answer: A

Explanation:

Option A: Endpoint agent deployment is managed separately and does not involve editing cloud security posture policies. These policies focus on assessing and maintaining compliance, not endpoint management.

Option B: Runtime protection for containers is handled by Falcon Container and Kubernetes Sensors, not cloud security posture policies. These policies focus on identifying and remediating misconfigurations in cloud environments.

Option C: Falcon Cloud Security Posture policies are designed to align cloud configurations with compliance frameworks (e.g., CIS, NIST). By editing these policies, administrators can customize rules to meet organizational or regulatory requirements and enforce compliance across multi- cloud environments.

Option D: While logging configurations can impact costs, cloud security posture policies do not handle logging management. This is done through cloud provider settings, not Falcon policies.

NEW QUESTION # 144

During a container security audit, a security team finds that multiple Kubernetes pods are publicly accessible from the internet due to a misconfigured ingress rule. Which of the following actions should the team take first to mitigate the risk?

- A. Shut down all affected pods immediately to prevent unauthorized access.
- B. Change the container runtime from Docker to containerd to improve security and reduce exposure risks.
- **C. Modify the Kubernetes Ingress and NetworkPolicy rules to restrict public access only to necessary endpoints.**
- D. Disable all public-facing networking in the cloud provider settings, blocking all traffic to the cluster.

Answer: C

Explanation:

Option A: Misconfigured Kubernetes ingress rules can expose sensitive services to the internet.

The correct action is to update Ingress and NetworkPolicy rules to limit access to only trusted sources and necessary endpoints, reducing exposure while maintaining functionality.

Option B: Changing the container runtime (e.g., Docker to containerd) can have security benefits, but it does not resolve misconfigured network exposure.

Option C: Shutting down pods immediately may prevent unauthorized access but could also cause operational disruptions. The correct approach is to first secure network access before considering pod restarts.

Option D: Disabling all public-facing networking is an extreme action that may impact legitimate services. The issue should be addressed through precise network policy adjustments rather than blanket restrictions.

NEW QUESTION # 145

Which of the following steps is required to configure a cloud account using APIs for integration with CrowdStrike Falcon?

- A. Provide read-only API access to the Falcon platform for monitoring and reporting.
- B. Manually deploy CrowdStrike agents on all workloads before registering the account via APIs.
- C. Directly upload API credentials to the CrowdStrike Falcon Console without generating an API client.
- **D. Generate an API client with appropriate permissions and use it to authenticate and register the cloud account.**

Answer: D

Explanation:

Option A: Read-only API access is insufficient for full functionality, as CrowdStrike Falcon requires the ability to monitor, enforce policies, and take corrective actions. Limited API access would restrict key security features.

Option B: Generating an API client ensures that CrowdStrike Falcon can authenticate securely and perform necessary tasks, such as registering the cloud account, retrieving metadata, and monitoring resources. The API client is configured with permissions scoped to enable integration without over privileging.

Option C: Directly uploading API credentials without an API client configuration bypasses the secure framework established by CrowdStrike. Proper API client generation is critical to ensuring that permissions are managed securely and efficiently.

Option D: Deploying agents on workloads is not a prerequisite for account registration. Agents are workload-specific and managed after the account has been integrated using APIs. This step conflates workload setup with account configuration.

NEW QUESTION # 146

When configuring a cloud account using APIs in CrowdStrike, which of the following is the correct first step to ensure the account is successfully registered and operational in the CrowdStrike Falcon platform?

- **A. Generate an API client ID and secret in the CrowdStrike Falcon console.**
- B. Directly input the cloud provider's credentials into the CrowdStrike console.
- C. Use the CrowdStrike API to configure granular IAM policies before registration.
- D. Assign full administrator access to the CrowdStrike service account in the cloud provider.

Answer: A
