It imitates the actual pattern of the NS0-185 Exam. This format works on Windows-based devices and requires no internet connection. The dedicated support team works hard to resolve any problem at any time.

Network Appliance NetApp Storage Installation Engineer, ONTAP Professional Exam Sample Questions (Q63-Q68):

NEW QUESTION # 63

During an installation of an AFF A400 cluster, you need to configure secure multitenancy. What will enable you to accomplish this task?

- A. broadcast domains
- B. IPspaces

- C. VLANs
- D. failover groups

Answer: B

Explanation:

Secure multitenancy in ONTAP requires complete separation of network traffic, routing tables, and IP addressing. IPspaces provide this level of isolation by creating independent network stacks within a single ONTAP cluster.

Failover groups, VLANs, and broadcast domains organize network paths but do not isolate routing domains.

Only IPspaces ensure tenants cannot access each other's network traffic.

Thus, IPspaces enable secure multitenancy.

NEW QUESTION # 64

You are adding new nodes to a 2-node switchless cluster.

According to NetApp, what must you do before adding the nodes?

- A. You must configure vservers peering.
- B. You must enable a cluster HA.
- C. You must install interconnect switches.
- D. You must configure cluster peering.

Answer: C

Explanation:

A 2-node switchless cluster is a special ONTAP configuration that allows two nodes to communicate directly without cluster interconnect switches. However, this design has strict scalability limitations.

NetApp documentation clearly states that switchless clusters are limited to two nodes only. Before adding additional nodes, the cluster must be converted to a switched cluster by installing cluster interconnect switches. This is a mandatory architectural requirement.

Installing interconnect switches provides the necessary redundant, high-speed connectivity required to support more than two nodes.

Without cluster switches, additional nodes cannot participate in cluster communication, and ONTAP will not allow them to join.

Cluster peering and vservers peering are unrelated to cluster expansion and are used for replication and data access between clusters or SVMs. Enabling cluster HA is already inherent in a switchless cluster and does not address the physical connectivity requirement.

Therefore, before adding nodes to a 2-node switchless cluster, interconnect switches must be installed, making B the correct answer.

NEW QUESTION # 65

After updating BES-53248 cluster switches, which two commands verify a healthy cluster? (Choose two.)

- A. network port show -ipSpace Cluster
- B. network device-discovery show -protocol cdp
- C. network interface show -vservers Cluster -fields auto-revert
- D. network interface show -vservers Cluster

Answer: A,D

NEW QUESTION # 66

Where is user data (file access) written to by default?

- A. Aggr0_root
- B. mailbox disks
- C. Vol0_root
- D. SVM volume

Answer: D

Explanation:

User data in ONTAP is written to volumes owned by Storage Virtual Machines (SVMs). Root aggregates and root volumes are

reserved for system metadata and ONTAP operations. Mailbox disks store HA metadata only. Therefore, user data is written to anSVM volume.

NEW QUESTION # 67

A customer is migrating data from a FAS8020 (ONTAP 9.5) to an AFF A250 MetroCluster IP system. Which two migration methods are supported? (Choose two.)

- A. Controller swap
- B. Configure SnapMirror between the systems
- C. Use a host-based copy migration method
- D. Create a 4-node cluster and use vol move

Answer: B,C
