CTFL-AT Study Guide: ISTQB Certified Tester - Foundation Level Extension - Agile Tester & CTFL-AT Dumps Torrent & CTFL-AT Latest Dumps

Do you want to have a new change about your life? Do you want to get more respects from other people? Do you long to become a powerful people? If your answer is yes, it is high time for you to use the CTFL-AT question torrent from our company. As the saying goes, opportunities for those who are prepared. If you have made up your mind to get respect and power, the first step you

need to do is to get the CTFL-AT Certification, because the certification is a reflection of your ability. If you have the CTFL-AT certification, it will be easier for you to get respect and power. Our company happened to be designing the CTFL-AT exam question.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q65-Q70):

NEW QUESTION # 65
Based on the skills required for testers in Agile teams, which of the following activities would you expect least likely to be performed by testers in Agile projects?

- A. Tracking the failures of the unit tests that are written when using the Test-Driven Development practice
- B. Working collaboratively with a developer to develop and test a feature
- C. Identifying and updating test cases from previous iterations that are affected by the changes made in the current iteration
- D. Actively participating in specification workshops aimed at clarifying user stories through examples that will be transformed into tests

Answer: A

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
FromCTFL-AT Syllabus v4.0, Section 3.2Test-Driven Development, and 1.3The Whole-Team Approach, testers:
"Collaborate in test-related activities including test case creation, exploratory testing, and user story clarification."
"Unit tests are typically the responsibility of developers, especially in TDD practices." Therefore,Option Aisleast likely, asunit test tracking in TDDis primarily adeveloper responsibility, not a tester's routine task.
* Options B, C, and D all describekey Agile tester activities, such asmaintaining regression tests, collaborating with developers, andparticipating in specification workshops (BDD/ATDD practices)
.

Learning Objective (K2) - Understand tester roles and responsibilities in Agile

NEW QUESTION # 66
An Agile project is aimed at developing an e-commerce website that will allow registered users to purchase digital books. During the checkout process, only credit card payments, with supported credit card types, will be accepted.
Consider the following acceptance criterion for a given user story of this Agile project:
"Check that the number of steps required to complete a purchase order during the checkout process is minimized, in order to reduce the risk that the customers will leave the website without completing their orders." Which of the following information would you expect to be the most relevant to create a test aimed at covering this acceptance criterion?

- A. The maximum number of steps to complete the registration process
- B. The maximum number of steps to complete the checkout process
- C. The supported credit card types
- D. The maximum number of digital books that can be purchased in a single order

Answer: B

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
FromCTFL-AT Syllabus v4.0, Section 2.1Acceptance Criteria and Testability, it states:
"Tests should directly address the acceptance criteria defined for a user story. Testers evaluate if the implemented feature meets the criteria, often using quantitative data like number of steps, time taken, or interaction patterns."Theacceptance criterionspecifically refers tominimizing steps during checkout, soOption Dis most directly aligned with what needs to be tested.
* Options A, B, and Care unrelated to the acceptance criterion's goal of reducing abandonment due to complex checkout.

CTFL-AT Syllabus v4.0, Section 2.1
Learning Objective (K2) - Understand testability of acceptance criteria

NEW QUESTION # 67
Which of the following statements is true?

- A. Early and frequent feedback in Agile projects helps maintain a uniform distribution of defects through the code and thus avoid defect clustering
- B. Early and frequent feedback in Agile projects allows the team to provide customers with products that better meet their requirements sooner
- C. Early and frequent feedback in Agile projects provides earlier information about the stability of the software product but not about its quality
- D. Early and frequent feedback in Agile projects allows the team to find a greater number of defects at the unit test level than in non-Agile projects

Answer: B

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
From the CTFL-AT Syllabus v4.0, Section 2.3 The Role of Feedback, it explains:
"Agile development promotes early and continuous feedback, which leads to the development of a product that better meets customer needs and expectations." Also:
"Frequent feedback loops support the team in identifying and resolving issues earlier, improving both the product quality and customer satisfaction." Therefore, Option D is the most accurate reflection of the true benefit of early and frequent feedback in Agile environments.
* Option A incorrectly implies Agile feedback redistributes defect clustering, which is not a recognized principle.
* Option B makes an unverifiable claim about defect volume at the unit level. Agile encourages unit testing, but this comparison is not substantiated in the syllabus.
* Option C is incorrect because feedback provides both stability and quality indicators early on.

CTFL-AT Syllabus v4.0, Section 2.3
Learning Objective (K2) - Understand the role of feedback in Agile projects

NEW QUESTION # 68
Why is regression of software a high risk in agile projects?

- A. Test automation can cause regression of software in the test environment.
- B. Regression is built into software as a safeguard against unexpected failures.
- C. Test-driven development means that existing functionality is not considered.
- D. There is code churn due to change in business needs over several sprints.

Answer: D

Explanation:
Regression of software is the risk that a change in one part of the software causes a defect in another part of the software that was previously working correctly. Regression of software is a high risk in agile projects because there is code churn due to change in business needs over several sprints. Code churn is the amount of code that is added, modified, or deleted in a software project over time. Code churn can indicate the volatility and complexity of the software, and the frequency and magnitude of the changes. In agile projects, code churn can be high because the business needs and the user requirements can change rapidly and frequently over several sprints, which are short iterations of development and testing. This means that the software is constantly evolving and adapting to the changing needs, and that the existing functionality and quality may be affected by the new or modified code. Therefore, regression of software is a high risk in agile projects, and it requires effective testing strategies and techniques to prevent, detect, and fix the regression defects. NEW QUESTION # 69
Which of the following is NOT a typical task performed by the tester within an Agile team?

- A. Suggesting improvements in team retrospectives.
- B. Ensuring all project status meetings are held according to the plan.
- C. Ensuring the appropriate testing tasks are scheduled during iteration planning.
- D. Working with business stakeholders to clarify requirements.

Answer: B

Explanation:
Explanation
The tester within an Agile team is not responsible for ensuring all project status meetings are held according to the plan. This is typically a task for the Scrum Master, who facilitates the meetings and ensures that the team follows the Agile principles and practices. The tester within an Agile team is responsible for ensuring the appropriate testing tasks are scheduled during iteration planning, suggesting improvements in team retrospectives, and working with business stakeholders to clarify requirements. These are all tasks that contribute to the quality of the software and the testing process, as well as the collaboration and communication within the team and with the customers.
