## Fortinet NSE 8 - Written Exam (NSE8\_812) Sample Questions (Q95-Q100):

### NEW QUESTION # 95

Refer to the exhibit.

The exhibit shows the topology a customer wants to implement using a flexible authentication scheme. Users connecting from trusted remote locations are authenticated using only their username/password when connecting to the SSLVPN FortiGate in the data

center.

When connecting from the Untrusted Clients, users must authenticate using 2-factor authentication.

In this scenario, which RADIUS attribute can be used as a RADIUS policy selector on the FortiAuthenticator to accomplish this goal?

- A. Login-IP-Host
- **B. Tunnel-Client-Auth-Id**
- C. Calling-Station-Id
- D. Framed-IP-Address

**Answer: B**

#### NEW QUESTION # 96

Which two methods are supported for importing user defined Lookup Table Data into the FortiSIEM?

(Choose two.)

- A. FTP
- B. SCP
- **C. Report**
- **D. API**

**Answer: C,D**

Explanation:

FortiSIEM supports two methods for importing user defined Lookup Table Data:

\* Report: You can import lookup table data from a report. This is the most common method for importing lookup table data.

\* API: You can also import lookup table data using the FortiSIEM API. This is a more advanced method that allows you to import lookup table data programmatically.

FTP, SCP, and other file transfer protocols are not supported for importing lookup table data into FortiSIEM.

#### NEW QUESTION # 97

An administrator has configured a FortiGate device to authenticate SSL VPN users using digital certificates. A FortiAuthenticator is the certificate authority (CA) and the Online Certificate Status Protocol (OCSP) server.

Part of the FortiGate configuration is shown below:

Based on this configuration, which two statements are true? (Choose two.)

- A. The OCSP check of the certificate can be combined with a certificate revocation list.
- **B. OCSP checks will always go to the configured FortiAuthenticator**
- C. OCSP certificate responses are never cached by the FortiGate.
- **D. If the OCSP server is unreachable, authentication will succeed if the certificate matches the CA.**

**Answer: B,D**

Explanation:

A is correct because the OCSP server is configured as the FortiAuthenticator in the config vpn certificate ocsf-server section. D is correct because the config vpn ssl settings section has set ocsf-option to allow. This means that if the OCSP server is unreachable, authentication will succeed if the certificate matches the CA. Reference:

#### NEW QUESTION # 98

A customer with a FortiDDoS 200F protecting their fibre optic internet connection from incoming traffic sees that all the traffic was dropped by the device even though they were not under a DoS attack. The traffic flow was restored after it was rebooted using the GUI. Which two options will prevent this situation in the future?

(Choose two)

- A. Move the internet connection from the SFP interfaces to the LC interfaces
- **B. Replace with a FortiDDoS 1500F**

- C. Create an HA setup with a second FortiDDoS 200F
- D. Change the Adaptive Mode.

**Answer: B,C**

Explanation:

\* B is correct because creating an HA setup with a second FortiDDoS 200F will provide redundancy in case one of the devices fails. This will prevent all traffic from being dropped in the event of a failure.

\* D is correct because the FortiDDoS 1500F has a larger throughput capacity than the FortiDDoS 200F.

This means that it will be less likely to drop traffic even under heavy load.

The other options are incorrect. Option A is incorrect because changing the Adaptive Mode will not prevent the device from dropping traffic. Option C is incorrect because moving the internet connection from the SFP interfaces to the LC interfaces will not change the throughput capacity of the device.
