Amazon AWS Certified Cloud Practitioner Sample Questions (Q855-Q860):

NEW QUESTION # 855

A company is setting up AWS Identity and Access Management (IAM) on an AWS account. Which recommendation complies with IAM security best practices?

- A. Use the account root user access keys for administrative tasks.
- B. Grant broad permissions so that all company employees can access the resources they need.
- C. Avoid rotating credentials to prevent issues in production applications.
- **D. Turn on multi-factor authentication (MFA) for added security during the login process.**

Answer: D

Explanation:

C is correct because turning on multi-factor authentication (MFA) for added security during the login process is one of the IAM security best practices recommended by AWS. MFA adds an extra layer of protection on top of the user name and password, making it harder for attackers to access the AWS account. A is incorrect because using the account root user access keys for administrative tasks is not a good practice, as the root user has full access to all the resources in the AWS account and can cause irreparable damage if compromised. AWS recommends creating individual IAM users with the least privilege principle and using roles for applications that run on Amazon EC2 instances. B is incorrect because granting broad permissions so that all company employees can access the resources they need is not a good practice, as it increases the risk of unauthorized or accidental actions on the AWS resources. AWS recommends granting only the permissions that are required to perform a task and using groups to assign permissions to IAM users. D is incorrect because avoiding rotating credentials to prevent issues in production applications is not a good practice, as it increases the risk of credential leakage or compromise. AWS recommends rotating credentials regularly and using temporary security credentials from AWS STS when possible.

NEW QUESTION # 856

A company has a workload that requires data to be collected, analyzed, and stored on premises. The company wants to extend the use of AWS services to run on premises with access to the company network and the company's VPC. Which AWS service meets this requirement?

- **A. AWS Outposts**
- B. AWS Direct Connect
- C. AWS Storage Gateway
- D. AWS Snowball

Answer: A

Explanation:

Explanation

AWS Outposts is an AWS service that meets the requirement of running AWS services on premises with access to the company network and the company's VPC. AWS Outposts is a fully managed service that extends AWS infrastructure, AWS services, APIs, and tools to virtually any datacenter, co-location space, or on-premises facility for a truly consistent hybrid experience. AWS Outposts is ideal for workloads that require low latency access to on-premises systems, local data processing, or local data storage.

NEW QUESTION # 857

Which AWS service or feature is associated with a subnet in a VPC and is used to control inbound and outbound traffic?

- **A. Network ACLs**
- B. Amazon Inspector
- C. VPC Flow Logs
- D. AWS Shield

Answer: A

Explanation:

Explanation

Network ACLs (network access control lists) are an optional layer of security for your VPC that act as a firewall for controlling traffic in and out of one or more subnets. You can use network ACLs to allow or deny traffic based on protocol, port, or source and destination IP address. Network ACLs are stateless, meaning that they do not track the traffic that flows through them.

Therefore, you must create rules for both inbound and outbound traffic.

NEW QUESTION # 858

Which of the following is a fully managed graph database service on AWS?

- A. Amazon Aurora
- B. Amazon DynamoDB
- C. Amazon FSx
- **D. Amazon Neptune**

Answer: D

Explanation:

Amazon Neptune is a fully managed graph database service on AWS. A graph database is a type of database that stores and queries data as a network of nodes and edges, representing entities and relationships. Graph databases are useful for applications that deal with highly connected data, such as social networks, recommendation engines, fraud detection, and knowledge graphs⁴⁵. Amazon Neptune is a fast, reliable, and scalable graph database service that supports two popular graph models: property graphs and RDF. Amazon Neptune also supports two open standards for querying graphs: Apache TinkerPop Gremlin and SPARQL. Amazon Neptune handles the heavy lifting of managing the database, such as provisioning, patching, backup, recovery, encryption, and replication^{45,6}. NEW QUESTION # 859

A company wants to improve its security and audit posture by limiting Amazon EC2 inbound access. According to the AWS shared responsibility model, which task is the responsibility of the customer?

- A. Configure the security used by managed services.
- B. Protect the global infrastructure that runs all of the services offered in the AWS Cloud.
- **C. Configure logical access controls for resources, and protect account credentials.**
- D. Patch and back up Amazon Aurora.

Answer: C

Explanation:

Explanation

According to the AWS shared responsibility model, the customer is responsible for configuring logical access controls for resources, and protecting account credentials. This includes managing IAM user permissions, security group rules, network ACLs, encryption keys, and other aspects of access management¹. AWS is responsible for protecting the global infrastructure that runs all of the services offered in the AWS Cloud, such as the hardware, software, networking, and facilities. AWS is also responsible for configuring the security used by managed services, such as Amazon RDS, Amazon DynamoDB, and Amazon Aurora².
