Salesforce Certified MuleSoft Platform Architect Sample Questions (Q65-Q70):

NEW QUESTION # 65

A REST API is being designed to implement a Mule application.

What standard interface definition language can be used to define REST APIs?

- A. AsyncAPI Specification
- B. YAML
- C. OpenAPI Specification (OAS)
- D. Web Service Definition Language (WSDL)

Answer: C

NEW QUESTION # 66

What is a best practice when building System APIs?

- A. Document the API using an easily consumable asset like a RAML definition
- **B. Model all API resources and methods to closely mimic the operations of the backend system**
- C. Expose to API clients all technical details of the API implementation's interaction with the backend system
- D. Build an Enterprise Data Model (Canonical Data Model) for each backend system and apply it to System APIs

Answer: B

Explanation:

Correct Answer: Model all API resources and methods to closely mimic the operations of the backend system

>> There are NO fixed and straight best practices while opting data models for APIs. They are completely contextual and depends on number of factors. Based upon those factors, an enterprise can choose if they have to go with Enterprise Canonical Data Model or Bounded Context Model etc.

>> One should NEVER expose the technical details of API implementation to their API clients. Only the API interface/ RAML is exposed to API clients.

>> It is true that the RAML definitions of APIs should be as detailed as possible and should reflect most of the documentation. However, just that is NOT enough to call your API as best documented API. There should be even more documentation on Anypoint Exchange with API Notebooks etc. to make and create a developer friendly API and repository..

>> The best practice always when creating System APIs is to create their API interfaces by modeling their resources and methods to closely reflect the operations and functionalities of that backend system.

NEW QUESTION # 67

When must an API implementation be deployed to an Anypoint VPC?

- A. When the API implementation must be accessible within a subnet of a restricted customer-hosted network that does not allow public access
- B. When the API Implementation must write to a persistent Object Store
- C. When the API implementation must be deployed to a production AWS VPC using the Mule Maven plugin
- **D. When the API Implementation must invoke publicly exposed services that are deployed outside of CloudHub in a customer- managed AWS instance**

Answer: D

NEW QUESTION # 68

An API implementation is updated. When must the RAML definition of the API also be updated?

- **A. When the API implementation changes the structure of the request or response messages**
- B. When the API implementation is migrated from an older to a newer version of the Mule runtime
- C. When the API implementation changes from interacting with a legacy backend system deployed on-premises to a modern, cloud-based (SaaS) system
- D. When the API implementation is optimized to improve its average response time

Answer: A

Explanation:

Correct Answer: When the API implementation changes the structure of the request or response messages

>> RAML definition usually needs to be touched only when there are changes in the request/response schemas or in any traits on API.

>> It need not be modified for any internal changes in API implementation like performance tuning, backend system migrations etc..

NEW QUESTION # 69

An organization wants to create a Center for Enablement (C4E). The IT director schedules a series of meetings with IT senior

managers.

What should be on the agenda of the first meeting?

- A. Specify operating model for the MuleSoft Integrations division
- B. A walk through of common-services best practices for logging, auditing, exception handling, caching, security via policy, and rate limiting/throttling via policy
- C. Explore API monetization options based on identified use cases through MuleSoft
- **D. Define C4E objectives, mission statement, guiding principles, a**

Answer: D

Explanation:

In the initial meeting for establishing a Center for Enablement (C4E), it's essential to lay the foundational vision, objectives, and guiding principles for the team. Here's why this is crucial:

Clear Vision and Mission:

Defining the mission statement and objectives at the start ensures alignment within the organization and clarifies the C4E's role in supporting API-led development and integration practices.

Guiding Principles:

Establishing guiding principles will help the C4E maintain consistent practices and strategies across projects. This serves as a framework for decisions and fosters shared understanding among IT leaders and stakeholders.

of Correct Answer (A):

By prioritizing the C4E's objectives and mission, the organization builds a solid foundation, paving the way for subsequent meetings focused on technical standards, processes, and operating models.

of Incorrect Options:

Option B (API monetization) and Option C (common services best practices) are specific topics better suited for later discussions.

Option D (specifying the operating model) is an important step but typically follows the establishment of the C4E's objectives and vision.

For more on C4E objectives and foundational setup, refer to MuleSoft's documentation on establishing a C4E and the roles and mission statements recommended for such initiatives.
