CompTIA A+ Certification Exam: Core 1 Sample Questions (Q537-Q542):

NEW QUESTION # 537
A technician needs to confirm that desktop PCs can be deployed to a global, remote workforce. Which of the following specifications should the technician validate?

- A. Power efficiency
- B. Supply chain security
- C. Input voltage
- D. BIOS language support

Answer: C

Explanation:
Input voltage must be validated to ensure desktop PCs can operate in different regions with varying power standards (e.g., 110V in North America vs. 220V in Europe). Failure to verify input voltage compatibility can lead to hardware damage or operational issues.
Option B (BIOS language support): Incorrect. While language support may be helpful, it is not critical for hardware deployment across regions.
Option C (Supply chain security): Incorrect. This refers to ensuring secure sourcing of components but does not directly impact deployment.
Option D (Power efficiency): Incorrect. Power efficiency may be important for energy savings but is not relevant to regional compatibility.

NEW QUESTION # 538
Which of the following twisted pair cables supports 10GBASE-T data transmission speed?

- A. Cat 6a
- B. Cat 5
- C. Cat 5e
- D. Cat 3

Answer: A

Explanation:
Cat 6a (augmented) is a type of twisted pair cable that supports 10GBASE-T data transmission speed. 10GBASE-T is an Ethernet standard that can deliver 10 gigabits per second (Gbps) over copper cables. Cat 6a can support this speed up to a distance of 100 meters, which is the same as Cat 5e and Cat 6 for lower speeds. Cat 6a has better shielding and crosstalk prevention than Cat 6, which makes it more suitable for high-frequency signals.
Cat 3, Cat 5, and Cat 5e are not capable of supporting 10GBASE-T data transmission speed. Cat
3 can only support up to 10 Mbps, Cat 5 can only support up to 100 Mbps, and Cat 5e can only support up to 1 Gbps. These cables have lower bandwidth, higher attenuation, and more interference than Cat 6a.

NEW QUESTION # 539
A user reports issues with a smartphone after dropping it. The icons on the screen all look normal, but when the user touches the email icon, for example, nothing happens. Which of the following is MOST likely the cause?

- A. Overheating
- B. Malware
- C. Digitizer issues
- D. Broken screen

Answer: C

Explanation:
Symptoms such as the touch screen not responding to input indicate a problem with the digitizer,

NEW QUESTION # 540
A technician is tasked with installing additional RAM in a desktop computer. Which of the following types of RAM is MOST likely to be used?

- A. DDR3
- B. VRAM
- C. SODIMM
- D. ECC

Answer: A

Explanation:
DDR3 is the most commonly used RAM type in modern desktop computers. It is faster and more energy efficient than its predecessors, and offers larger capacity modules. Reference: CompTIA A+ Certification Exam Guide, Ninth Edition, Chapter 5

NEW QUESTION # 541
While troubleshooting a user's smartphone issue, a technician notices that the display is visible but extremely hard to see. Which of the following is the most likely issue?

- A. Digitizer
- B. Inverter
- C. LCD glass
- D. IPS panel

Answer: B

Explanation:
An inverter failure commonly causes dim screens as it fails to power the backlight, which is crucial for visibility. The LCD glass, IPS panel, and digitizer relate to touch and image display, not brightness. According to CompTIA A+ Core 1 objectives, understanding mobile device display issues, including inverter-related problems, is essential for effective troubleshooting.
