EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q44-Q49):

NEW QUESTION # 44

Question:

What is a read miss in cache operations?

- A. Writing data to the cache
- B. Fetching requested data that is already in cache
- C. Deleting data from the cache
- D. Fetching data that is not in cache

Answer: D

Explanation:

A read miss occurs when the data requested by the host is not available in the cache. As a result, the storage system must fetch the data from the slower disk storage (back-end), leading to higher latency.

* Cache hit: Data is already in cache # faster response.

* Cache miss (read miss): Data not in cache # fetched from the disk.

NEW QUESTION # 45

Question:

A company is experiencing slow write performance on its RAID 6 array. What is the most likely cause of this performance bottleneck?

- A. Increased network latency between the server and the storage array
- B. High read I/O load on the array
- C. Insufficient storage on the RAID controller
- D. Write penalty associated with dual parity calculations

Answer: D

Explanation:

RAID 6 uses dual parity to provide fault tolerance, which requires additional calculations during write operations. This introduces a write penalty, as the system must compute and write two sets of parity data for each write operation, leading to slower write performance compared to other RAID levels.

* Insufficient storage on the RAID controller: Would affect storage capacity, not write performance.

* High read I/O load on the array: Impacts read performance, not write performance.

* Increased network latency: Affects data transfer times but not the internal write operations of the RAID array.

* Write penalty associated with dual parity calculations: The most likely cause of slow write performance in RAID 6.

NEW QUESTION # 46

Question:

Which operations management process is responsible for maintaining information about configuration items (CIs)?

- A. Capacity management
- B. Performance management
- C. Change management
- D. Configuration management

Answer: D

Explanation:

Configuration Management is the process that ensures all configuration items (CIs) are identified, tracked, and maintained throughout their lifecycle. It maintains a Configuration Management Database (CMDB) that records the relationships and configurations of various components in the IT environment.

NEW QUESTION # 47

Question:

What is true about the FCIP?

- A. Connects local FC or iSCSI SANs to remote FC or iSCSI SANs
- **B. Connects local FC SANs to remote FC SANs**
- C. Connects local iSCSI SANs to remote FC SANs
- D. Connects local iSCSI SANs to remote iSCSI SANs

Answer: B

Explanation:

FCIP (Fibre Channel over IP) is used to tunnel Fibre Channel traffic over IP networks. Its primary use case:

- * Connecting local FC SANs to remote FC SANs for disaster recovery and remote data replication.
- * It encapsulates FC frames into IP packets, transporting them over existing IP infrastructure.
- * Option B/C/D: iSCSI is not directly involved in FCIP's primary function.

NEW QUESTION # 48

Question:

Which RAID level consists of two disk drives and every write is written to both disks?

- **A. RAID 1**
- B. RAID 1+0
- C. RAID 6
- D. RAID 5

Answer: A

Explanation:

RAID 1 is disk mirroring. It writes identical copies of data to two disks simultaneously, providing redundancy.

- * Minimum of 2 disks (no parity, no striping).
- * Excellent read performance, write performance equivalent to a single disk.
- * Provides fault tolerance because data is duplicated.
