# Valid HCVA0-003 training materials | HCVA0-003 exam prep: HashiCorp Certified: Vault Associate (003)Exam - Dumps4PDF

Individuals who pass the HashiCorp Certified: Vault Associate (003)Exam (HCVA0-003) certification exam demonstrate to their employers and clients that they have the knowledge and skills necessary to succeed in the industry. Dumps4PDF is aware that preparing with outdated HashiCorp Certified: Vault Associate (003)Exam (HCVA0-003) study material results in a loss of time and money.

## HashiCorp Certified: Vault Associate (003)Exam Sample Questions (Q53-Q58):

### NEW QUESTION # 53

When creating a policy, an error was thrown:

The screenshot shows the 'Create ACL policy' interface in HashiCorp Vault. At the top, there is a breadcrumb '< ACL Policies'. Below it, the title 'Create ACL policy' is displayed. A red error message box contains the text: 'Error failed to parse policy: path "secret/webapp/\*": invalid capability "write"'. Below the error, the 'Name' field contains 'webapp'. The 'Policy' field contains a code editor with the following JSON: 

```
1 path "secret/webapp/*" {
2   capabilities = ["read", "write", "delete", "list", "sudo"]
3 }
```

 An 'Upload file' button is visible to the right of the code editor. Below the code editor, a note states: 'You can use Alt+Tab (Option+Tab on MacOS) in the code editor to skip to the next field'. At the bottom, there are two buttons: 'Create policy' and 'Cancel'.

Which statement describes the fix for this issue?

- A. sudo is not a capability
- B. You cannot have a wildcard ("\*") in the path
- C. Replace write with create in the capabilities list

Answer: C

Explanation:

The error was thrown because the policy code contains an invalid capability, "write". The valid capabilities for a policy are "create",

"read", "update", "delete", "list", and "sudo". The "write" capability is not recognized by Vault and should be replaced with "create", which allows creating new secrets or overwriting existing ones. The other statements are not correct, because the wildcard (\*) and the sudo capability are both valid in a policy. The wildcard matches any number of characters within a path segment, and the sudo capability allows performing certain operations that require root privileges.

#### NEW QUESTION # 54

What is the correct order that Vault uses to protect data?

- A. encryption key --> root key --> data
- **B. root key --> encryption key --> data**
- C. unseal keys --> root key --> data
- D. root key --> data

**Answer: B**

Explanation:

Comprehensive and Detailed in Depth Explanation:

Vault protects data using a layered encryption process: root key --> encryption key --> data. The HashiCorp Vault documentation explains: "The data stored by Vault is encrypted. Vault needs the encryption key to decrypt it. The key is also stored with the data (in the keyring), but it is encrypted with another key known as the root key. Therefore, to decrypt the data, Vault must decrypt the encryption key, which requires the root key." This sequence ensures data security through multiple encryption layers.

The docs further clarify: "Unsealing is the process of accessing this root key. The root key is stored alongside all Vault data but is encrypted by yet another mechanism: the unseal key. To recap: most Vault data is encrypted using the encryption key in the keyring; the keyring is encrypted by the root key; and the root key is encrypted by the unseal key." Option B includes unseal keys but omits the encryption key's role. C and D misrepresent the order. Thus, A is correct.

#### NEW QUESTION # 55

You are configuring your application to retrieve a new PKI certificate upon provisioning. The Vault admins have given you an AppRole role-id and secret-id to inject into the CI/CD pipeline job that provisions your app. The application uses the credentials to successfully authenticate to Vault using the API. Which of the following is true about the step next required after authenticating to Vault?

- A. The initial API response should include the new PKI certificate and no further action is required
- B. The app still needs to use the role-id and secret-id to request the new PKI certificate via API
- C. Now that the app is authenticated, it can simply make another API request for the PKI certificate
- **D. The client token needs to be retrieved from the API response before requesting the new PKI certificate**

**Answer: D**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

After authenticating with AppRole using the role-id and secret-id via the API (e.g., POST /v1/auth/approle/login), Vault returns a response containing a client\_token. This token must be extracted for subsequent requests, such as retrieving a PKI certificate. The Vault documentation states:

"When you use the Vault API to authenticate, the Vault API response will include a client\_token that is tied to a specific policy.

Once you receive that response, it is up to the user (or application) to parse that response and retrieve the token. Once the token is retrieved, a second API request needs to be sent to Vault to request the new PKI certificate."

-Vault API: AppRole

\* A: Correct. The client\_token from the response (e.g., under .auth.client\_token) is required for the next request (e.g., POST /v1/pki/issue/<role>):

"The client token is necessary to make subsequent requests to Vault, including requesting the new PKI certificate."

-Vault API Documentation

\* B: Incorrect. Authentication doesn't return a PKI certificate; a separate request is needed.

\* C: Incorrect. The role-id and secret-id are for authentication, not certificate retrieval:

"Authentication and interaction with a secrets engine are separate actions."

-Vault API: AppRole

\* D: Partially true but vague; it omits the critical step of retrieving the token first.

Vault API: AppRole

Vault PKI Secrets Engine

### NEW QUESTION # 56

True or False? The following policy permits a user to read secrets contained in the path secrets/cloud/apps/jenkins?

text

CollapseWrapCopy

```
path "secrets/cloud/apps/jenkins/*" {
  capabilities = ["create", "read", "update", "delete", "list"]
}
```

- A. True
- B. False

**Answer: B**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

The policy's path syntax determines access:

\* B. False: "This policy will NOT permit access to secrets stored under secrets/cloud/apps/jenkins." The wildcard \* applies to paths after jenkins/, e.g., secrets/cloud/apps/jenkins/config, but not the exact path secrets/cloud/apps/jenkins. "Notice that in the policy, the wildcard (\*) is AFTER the path jenkins, and not AT the jenkins path."

\* Incorrect Option:

\* A. True: Incorrect; the policy requires an additional segment to match.

To permit secrets/cloud/apps/jenkins, the policy should be path "secrets/cloud/apps/jenkins" {} or include a broader wildcard like secrets/cloud/apps/\*.

### NEW QUESTION # 57

By default, what happens to child tokens when a parent token is revoked?

- A. The child tokens are converted to parent tokens
- B. The child tokens create their own child tokens to be used
- C. The child tokens are renewed
- D. The child tokens are revoked

**Answer: D**

Explanation:

Comprehensive and Detailed in Depth Explanation:

By default, when a parent token is revoked, all child tokens are also revoked. The HashiCorp Vault documentation (via support article) states: "When a parent token is revoked, all of its child tokens-and all of their leases-are revoked as well. This ensures that a user cannot escape revocation by simply generating a never-ending tree of child tokens." This hierarchical revocation ensures security by terminating all derived access when the parent is invalidated.

The documentation on tokens adds: "Tokens in Vault are part of a hierarchy. Child tokens inherit properties from their parents, and revoking a parent token cascades to its children." Options like renewal, conversion to parent tokens, or creating new child tokens do not occur by default. Thus, A is correct.
