CheckPoint Check Point Certified VSX Specialist - R81 (CCVS) Sample Questions (Q118-Q123):

NEW QUESTION # 118

Which deployment method is most suitable for a service provider hosting multiple customers?

- **A. Separate VSs with Autonomous Routing**
- B. NAT-based segmentation
- C. Single VS with VLAN tagging
- D. Distributed routing with shared policy

Answer: A

Explanation:

Separate VSs using Autonomous Routing provide full network and policy isolation, critical in multi-tenant environments like service providers. Each customer gets a dedicated routing instance and security context.

NEW QUESTION # 119

How can you generate a diagnostic snapshot of a VSX Gateway?

- **A. cpinfo -o**
- B. vsx_util diag
- C. collect_system_snapshot
- D. cpview collect

Answer: A

Explanation:

cpinfo -o generates a complete system diagnostic snapshot, which includes all VSX configurations, kernel parameters, and logs. This is used during support cases or deep troubleshooting efforts.

NEW QUESTION # 120

What must be defined when removing a Virtual System using the VSX Provisioning Tool?

- A. Associated policy
- B. Object UUID
- **C. VSID**
- D. VSX Gateway hostname

Answer: C

Explanation:

To remove a Virtual System using the VSX Provisioning Tool, you must specify its unique VSID. This ID identifies the Virtual System on the gateway and ensures the correct object is deleted without affecting others.

NEW QUESTION # 121

Which of the following statements about traffic flow in a VSX environment is correct?

- A. Traffic between VSs always goes through external interfaces
- **B. Virtual Switches or Routers direct internal VS-to-VS traffic**
- C. All VSs share one IP stack
- D. VS0 handles inter-VS traffic routing

Answer: B

Explanation:

Virtual Switches or Routers are responsible for directing traffic between Virtual Systems. These internal components enable isolated routing or switching without involving external interfaces.

NEW QUESTION # 122
