Infoblox Qualified NIOS DDI Expert - INE Sample Questions (Q45-Q50):

NEW QUESTION # 45

Which of the following transport protocols are supported by scheduled NIOS Grid Backup? (Select all that apply.)

- A. SCP

- B. HTTPS
- C. SFTP
- D. FTP

Answer: A,B,C,D

Explanation:

Comprehensive and Detailed In-Depth Explanation: NIOS Grid Backup allows scheduled exports of the configuration database (DNS, DHCP, Grid settings) to an external server. Supported protocols ensure flexibility and security:

* A (SFTP): Secure File Transfer Protocol (SSH-based) is supported for encrypted backups to remote servers (port 22). Widely used for secure transfers. Correct.

* B (SCP): Secure Copy Protocol (also SSH-based) is supported, offering a simple, secure file transfer option (port 22). Correct.

* C (FTP): File Transfer Protocol (unencrypted, port 21) is supported for legacy systems, though less secure. Correct.

* D (HTTPS): Web-based secure transfer (port 443) is supported, allowing backups to HTTP servers with SSL/TLS encryption. Correct.

* Setup: In Grid Manager (Grid > Grid Manager > Backup), you configure the protocol, server IP, and credentials.

* Practical Example: In an INE lab, you'd schedule a backup using SFTP to a remote server, test restoration, and troubleshoot connectivity issues, reinforcing Grid deployment skills.

* Note: All four are explicitly supported per NIOS documentation, making this a comprehensive list.

NEW QUESTION # 46

What is the purpose of the "Override" button in the context of settings inheritance?

- A. To apply the same settings across all hierarchy levels simultaneously
- B. To change the settings at a lower level, overriding the inherited values
- C. To reset all settings to their default values
- D. To prevent any changes to settings at lower hierarchy levels

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation: Settings inheritance in NIOS allows higher-level configurations (e.g., Grid-wide) to propagate to lower levels (e.g., members):

* Override Button: Found in Grid Manager (e.g., Grid > Members > Edit), it lets admins modify a setting at a lower level (e.g., member-specific DHCP options), breaking inheritance from the parent (e.g., Grid).

* Why C: Overriding replaces the inherited value with a custom one for that object, tailoring behavior without affecting others.

* Options:

* A: Resetting to defaults is a separate action (e.g., "Revert to Default"). Incorrect.

* B: Preventing changes contradicts override's purpose—it enables change. Incorrect.

* C: Matches the function—alter lower-level settings. Correct.

* D: Applying uniformly isn't overriding—it's setting at a higher level. Incorrect.

* Practical Example: In an INE lab, you'd override a Grid-wide DNS TTL (3600s) to 300s on one member, test resolution, and troubleshoot inheritance conflicts. References: Infoblox NIOS Administrator Guide - Inheritance; INE Course Objective: NIOS DDI Grid Deployment.

NEW QUESTION # 47

Which stage of a NIOS upgrade is generally expected to take the shortest time?

- A. Upload
- B. Upgrade
- C. Test
- D. Distribute

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation: NIOS upgrade stages (Grid > Upgrade):

- * A (Upload): Uploading the .upgrade file (e.g., 50-200 MB) to the GM is quick-seconds to minutes, depending on network speed. Shortest. Correct.
- * B (Test): Validates file integrity/compatibility-fast but longer than upload (e.g., 1-2 minutes). Incorrect.
- * C (Distribute): Sending the file to all members takes longer, proportional to Grid size/network (e.g., 5-15 minutes). Incorrect.
- * D (Upgrade): Rebooting and applying the update per member is the longest (e.g., 10-30 minutes total). Incorrect.
- * Practical Example: In an INE lab, upload takes 30s, while distribution and upgrade take 10+ minutes, testing Grid deployment timing. References: Infoblox NIOS Administrator Guide - Upgrade Process; INE Course Content: NIOS DDI Grid Deployment.

NEW QUESTION # 48

When a Force Failover is performed on a HA pair, what is the priority that is set in the VRRP packet send from the Active to the Passive Node?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation: VRRP governs HA failover in NIOS, using priority values (0-255) to determine the active node. Here's the detailed process:

- * Normal Operation: The active node has a higher priority (e.g., 100) than the passive node (e.g., 90), set during HA configuration.
- * Force Failover: In Grid Manager (Grid > Members > Force Failover), the admin triggers a manual switch. The active node sends a VRRP advertisement with priority 255 to assert itself as the master, then lowers its priority (e.g., to 90), allowing the passive node (now higher, e.g., 100) to take over.
- * Why 255: Per VRRP standards (RFC 3768), 255 is the highest priority, reserved for the master to signal ownership or force transitions. Post-failover, priorities revert to configured values.
- * Options:
 - * A (0): Signals a node is shutting down, not forcing failover. Incorrect.
 - * C (1024): Exceeds VRRP's 8-bit range (0-255). Invalid.
 - * D (128): A possible priority, but not the forced failover value. Incorrect.
- * Practical Example: In an INE lab, you'd force failover, capture VRRP packets (e.g., with Wireshark), and verify the 255 priority, troubleshooting HA behavior. References: Infoblox NIOS Administrator Guide - HA Failover; RFC 3768 (VRRP); INE Course Content: NIOS DDI Grid Troubleshooting.

NEW QUESTION # 49

What baud rate does the Serial Console use?

- A. 9600 bps
- B. 57600 bps
- C. 2400 bps
- D. 39400 bps

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation: The serial console on Infoblox appliances provides low-level access for diagnostics:

- * Default Settings: Per NIOS documentation, the serial port operates at 9600 baud, with 8 data bits, no parity, 1 stop bit (8N1). This is an industry-standard rate for serial terminals, balancing speed and reliability.
- * Verification: Connecting via a terminal emulator (e.g., PuTTY, minicom) requires matching 9600 bps- mismatched rates garble output, a common troubleshooting issue.
- * Options:
 - * A (2400): Too slow, used in older systems, not Infoblox. Incorrect.
 - * B (9600): Matches NIOS spec. Correct.

- * C (39400):Non-standard, likely a typo (38400 is common elsewhere, but not here). Incorrect.
- * D (57600):Faster rate for modern devices, not Infoblox default. Incorrect.
- * Practical Example:In an INE lab, you'd set PuTTY to 9600 bps, connect via null modem cable, and view boot logs, troubleshooting a Grid member's startup.References:Infoblox NIOS Administrator Guide - Serial Console; INE Course Content: NIOS DDI Grid Troubleshooting.
