By unremitting effort and studious research of the Cloud-Deployment-and-Operations practice materials, they devised our high quality and high effective Cloud-Deployment-and-Operations practice materials which win consensus acceptance around the world. They are meritorious experts with a professional background in this line and remain unpretentious attitude towards our Cloud-Deployment-and-Operations practice materials all the time. They are unsuspecting experts who you can count on.

WGU Cloud-Deployment-and-Operations Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Cloud Service Deployment and Management: This section of the exam measures skills of Cloud Engineers and covers the technical knowledge required to deploy, manage, and operate cloud services. It focuses on understanding stability, scalability, backup processes, recovery methods, and general deployment practices. Candidates are expected to show they can handle provisioning, monitoring, and connectivity tasks needed to support cloud environments.

Topic 2	<ul style="list-style-type: none"> • Ensuring Scalability, Elasticity, and Backup Readiness: This section of the exam measures skills of Cloud Operations Specialists and covers implementing AWS features that support scalability, elasticity, and backup readiness. It focuses on enabling cloud systems to handle fluctuating workloads while maintaining continuity and ensuring critical data remains recoverable.
Topic 3	<ul style="list-style-type: none"> • Automating Cloud Provisioning and Maintenance: This section of the exam measures skills of Cloud Operations engineers and covers the ability to automate provisioning tasks and ongoing maintenance activities. It emphasizes using automation tools to streamline cloud resource creation and lifecycle management. Students must demonstrate they can apply automation to maintain efficient cloud operations.
Topic 4	<ul style="list-style-type: none"> • Implementing Cloud Security and Compliance: This section of the exam measures skills of Cloud Engineers and covers the use of AWS security tools to protect data and infrastructure. Candidates must demonstrate awareness of compliance needs and the ability to apply protective controls that align with industry and organizational standards.
Topic 5	<ul style="list-style-type: none"> • Configuring Cloud Network Connectivity: This section of the exam measures skills of Cloud Engineers and covers network connectivity within AWS environments, including setup, troubleshooting, and corrective actions. Candidates must show they can manage cloud networking in a way that ensures reliable communication between systems and services.

Hot Cloud-Deployment-and-Operations Latest Exam Papers Pass Certify | Latest New Cloud-Deployment-and-Operations Braindumps Pdf: WGU Cloud Deployment and Operations

The Cloud-Deployment-and-Operations exam dumps are designed efficiently and pointedly, so that users can check their learning effects in a timely manner after completing a section. Good practice on the success rate of Cloud-Deployment-and-Operations quiz guide is not fully indicate that you have mastered knowledge is skilled, therefore, the Cloud-Deployment-and-Operations test material let the user consolidate learning content as many times as possible, although the practice seems very boring, but it can achieve the result of good consolidate knowledge. More importantly, you can pass the Cloud-Deployment-and-Operations exam and get the dreaming Cloud-Deployment-and-Operations certification.

WGU Cloud Deployment and Operations Sample Questions (Q48-Q53):

NEW QUESTION # 48

(Which function is used to obtain components defined in an AWS CloudFormation template?)

- **A. Ref**
- B. Cidr
- C. ImportValue
- D. GetAZs

Answer: A

Explanation:

The `Ref` function in an AWS CloudFormation template is used to obtain values of components defined within the template, such as resource IDs, parameters, or outputs. This function allows dynamic referencing of resources during stack creation. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Functions) states, "The `Ref` function is used to reference the logical IDs of resources, parameters, or mappings defined in the template, enabling dynamic value retrieval (e.g., `Ref: MyEC2Instance` returns the instance ID)." ImportValue is used for cross-stack references, Cidr for IP range calculations, and GetAZs for availability zone lists, making them unsuitable here.

NEW QUESTION # 49

(A company has implemented multifactor authentication (MFA) for access to its AWS tenant. Which API call is needed to perform

MFA before accessing a resource?)

- A. GetFederationToken
- B. GetCallerIdentity
- C. DecodeAuthorizationMessage
- **D. GetSessionToken**

Answer: D

Explanation:

The 'GetSessionToken' API call is needed to perform MFA before accessing a resource, as it generates temporary security credentials for an IAM user after MFA validation. This ensures secure access to AWS resources. The WGU Cloud Deployment and Operations Study Guide (Section 6.2, IAM and MFA) states,

"The 'GetSessionToken' API is used with MFA to obtain temporary credentials, requiring a valid MFA code to authenticate the user before resource access is granted." GetCallerIdentity, GetFederationToken, and DecodeAuthorizationMessage serve different purposes and do not handle MFA authentication.

NEW QUESTION # 50

(Which service should be used to horizontally scale Amazon EC2 instances?)

- A. Elastic IPs
- **B. Elastic Load Balancing**
- C. Elastic network interface
- D. Elastic Beanstalk

Answer: B

Explanation:

Elastic Load Balancing (ELB) should be used to horizontally scale Amazon EC2 instances by distributing incoming traffic across multiple instances, improving availability and fault tolerance. ELB works in conjunction with Auto Scaling groups to add or remove instances based on demand. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Elastic Load Balancing) notes, "Elastic Load Balancing distributes traffic across EC2 instances, enabling horizontal scaling as part of an Auto Scaling group to handle increased load efficiently." Elastic IPs, elastic network interfaces, and Elastic Beanstalk do not provide this scaling functionality.

NEW QUESTION # 51

(An administrator successfully accesses an EC2 instance via SSH from a local computer then stops it and starts it. Following the restart, the EC2 instance is no longer accessible. Which solution should be used to resolve the issue?)

- A. Change the port used to connect to EC2 instance
- B. Add a route to the route table associated with the EC2 instance subnet
- **C. Add a rule to the security group associated with the NIC of the EC2 instance**
- D. Change the IP address used to connect to the EC2 instance

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

After stopping and starting an EC2 instance, the public IP address may change (unless an Elastic IP is attached), but the security group rules remain intact. If the instance is no longer accessible via SSH, it's likely due to an inbound rule (e.g., for port 22) not being correctly configured or applied. Adding or verifying a rule in the security group associated with the network interface (NIC) to allow SSH (port 22) from the administrator's IP resolves this. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Stopping and starting an EC2 instance may require verifying or adding an inbound SSH rule (port 22) in the security group if connectivity is lost due to IP or rule misconfiguration." Route table or IP changes are not the primary issue here.

NEW QUESTION # 52

(An administrator sees the following VPC flow log: 2 123456739010 eni-123bfecad12529 192.168.20.1

203.0.113.66 2066 22 20 7782 1645859356 1645859536 ACCEPT OK. What does the log indicate about the traffic flow?)

- A. Traffic from 192.168.20.1 to 203.0.113.66 with a source port of 2066 has been permitted.
- B. Traffic from 203.0.113.66 to 192.168.20.1 with a destination port of 2066 has been permitted.
- C. Traffic from 203.0.113.66 to 192.168.20.1 with a source port of 22 has been permitted.
- **D. Traffic from 192.168.20.1 to 203.0.113.66 with a destination port of 2066 has been permitted.**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The VPC flow log fields indicate the following: the source IP is 192.168.20.1, the destination IP is 203.0.113.66, the source port is 2066, the destination port is 22, and the action is "ACCEPT OK," meaning the traffic was permitted. This shows outbound traffic from the internal network (192.168.20.1) to an external IP (203.0.113.66) with destination port 2066. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Flow Logs) states, "In a flow log, the format includes source IP, destination IP, source port, destination port, and action; for example, 192.168.20.1 to 203.0.113.66 with source port 2066 and destination port 22 indicates permitted outbound traffic." Only option C correctly interprets this flow.
