The ISC modern job market is becoming more and more competitive and challenging and if you are not ready for it then you cannot pursue a rewarding career. Take a smart move right now and enroll in the Certified Information Systems Security Professional (CISSP) (CISSP) certification exam and strive hard to pass the Certified Information Systems Security Professional (CISSP) (CISSP) certification exam.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q354-Q359):

NEW QUESTION # 354

Which of the following are the limitations of the Bell-LaPadula model?

- A. Static in nature.
- B. No policies for changing access data control.
- C. Contains covert channels.
- D. All of the choices.

Answer: D

Explanation:

Limitations of the BLP model: Have no policies for changing access data control Intended for systems with static security levels
Contains covert channels: a low subject can detect the existence of a high object when it is denied access. Sometimes it is not enough to hide the content of an object; also their existence may have to be hidden. Restricted to confidentiality

NEW QUESTION # 355

What is considered the MOST important type of error to avoid for a biometric access control system?

- A. Type II Error
- B. Crossover Error Rate
- C. Type I Error
- D. Combined Error Rate

Answer: A

Explanation:

Explanation/Reference:

Explanation:

A Type II Error occurs when the system accepts impostors who should be rejected. This type of error is the most dangerous type, and therefore the most important to avoid.

Incorrect Answers:

A: A Type I Error is when a biometric system rejects an authorized individual. It is not as dangerous as a Type II Error, and therefore not the most important to avoid.

C: Combined Error Rate is not a valid type of biometric error.

D: The crossover error rate (CER) is a percentage that signifies the point at which the false rejection rate equals the false acceptance rate. It is the most important measurement when determining the system's accuracy.

NEW QUESTION # 356

Which of the following is NOT a responsibility of an information (data) owner?

- A. Determine what level of classification the information requires.
- B. Periodically review the classification assignments against business needs.
- C. Delegate the responsibility of data protection to data custodians.
- D. Running regular backups and periodically testing the validity of the backup data.

Answer: D

Explanation:

Explanation/Reference:

Explanation:

The data owner defines the backup requirements. However, the data owner does not run the backups.

This is performed by the data custodian.

The data owner is usually a member of management who is in charge of a specific business unit, and who is ultimately responsible for the protection and use of a specific subset of information. The data owner has due care responsibilities and thus will be held responsible for any negligent act that results in the corruption or disclosure of the data. The data owner decides upon the classification of the data she is responsible for and alters that classification if the business need arises. This person is also responsible for ensuring that the necessary security controls are in place, defining security requirements per classification and backup requirements, approving any disclosure activities, ensuring that proper access rights are being used, and defining user access criteria. The data custodian (information custodian) is responsible for maintaining and protecting the data. This role is usually filled by the IT or security department, and the duties include implementing and maintaining security controls; performing regular backups of the data; periodically validating the integrity of the data; restoring data from backup media; retaining records of activity; and fulfilling the requirements specified in the company's security policy, standards, and guidelines that pertain to information security and data protection.

Incorrect Answers:

A: Determining what level of classification the information requires is the responsibility of the data owner.

B: Periodically reviewing the classification assignments against business needs is the responsibility of the data owner.

C: Delegating the responsibility of data protection to data custodians is the responsibility of the data owner.

NEW QUESTION # 357

What best describes a scenario when an employee has been shaving off pennies from multiple accounts and depositing the funds into his own bank account?

- A. Data hiding
- B. Data fiddling
- C. Data diddling
- D. Data masking

Answer: C

Explanation:

This kind of an attack involves altering the raw data just before it is processed by a computer and then changing it back after the processing is completed. This kind of attack was used in the past to make what is stated in the question, steal small quantities of money and transfer them to the attackers account. See "Data deddling crimes" on the Web.

The most correct answer is 'Salami', but since that is not an option the most correct answer is data diddling.

"A salami attack is committing several small crimes with the hope that the overall larger crime will go unnoticed.An example would be if an employee altered a banking software program to subtract 5 cents from each of the bank's customers' accounts once a month and moved this amount to the employee's bank account. If this happened to all of the bank's 50,000 customer accounts, the intruder could make up to \$ 30,000 a year.

Data diddling refers to the alteration of existing data. Many times this modification happens before it is entered into an application or as soon as it completes processing and is outputted from an application.

There was an incident in 1997, in Maryland, where a Taco Bell employee was sentenced to ten years in jail because he reprogrammed the drive-up window cash register to ring up ever 42.99 order as one penny. He collected the full amount from the customer, put the penny in the till, and pocketed the other \$2.98. He made \$3600 before his arrest."

Pg. 602-603 Shon Harris: All-In-One CISSP Certification Exam Guide

NEW QUESTION # 358

Which of the following is included in change management?

- A. User Acceptance Testing (UAT) before implementation
- B. Cost-benefit analysis (CBA) after implementation
- C. Technical review by business owner
- D. Business continuity testing

Answer: A

Explanation:

User Acceptance Testing (UAT) before implementation is one of the steps included in change management. Change management is a process that ensures that any changes to the system or the environment are planned, approved, tested, implemented, and documented in a controlled and consistent manner. UAT is a type of testing that involves the end users or the stakeholders of the system, and it verifies that the system meets the functional and non-functional requirements and expectations. UAT is usually performed before the implementation of the system or the change, as a final validation step.

NEW QUESTION # 359

.....

Love is precious and the price of freedom is higher. Do you think that learning day and night has deprived you of your freedom? Then let Our CISSP guide tests free you from the depths of pain. Our study material is a high-quality product launched by the CISSP platform. And the purpose of our study material is to allow students to pass the professional qualification exams that they hope to see with the least amount of time and effort.
