CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q255-Q260):

NEW QUESTION # 255

A project sponsor has asked for a log listing all the bugs identified within a specific project. Which of the following tools should the project manager provide to the sponsor?

- A. Change log
- B. Defect log
- C. Risk register
- D. Issue log

Answer: B

Explanation:

A defect log specifically tracks bugs, errors, or defects discovered in the product. It includes descriptions, severity, and resolution. Issue logs capture broader non-technical challenges, while change logs and risk registers serve different purposes.

NEW QUESTION # 256

A company has developed an online trading platform. The engineering team selected event-based scaling for the platform's underlying resources. The platform resources scale up with every 2,000 subscribed users. The engineering team finds out that although compute utilization is low, scaling is still occurring. Which of the following statements best explains why this is the case?

- A. Event-based scaling should not track user subscriptions.
- B. Event-based scaling should not be triggered at the 2,000-user frequency.
- C. Event-based scaling does not scale down resources.
- **D. Event-based scaling does not take resource load into account.**

Answer: D

Explanation:

Event-based scaling triggers based on specific events, such as the number of user subscriptions in this case. It does not necessarily account for the actual load or utilization of compute resources. This is why the platform's resources continue to scale up even though compute utilization is low; the scaling decision is being made based on the number of subscribed users rather than the current resource usage.

NEW QUESTION # 257

An IT manager is migrating the production environment to the cloud but needs to keep control of the operating systems, patches, and settings of all resources. Which of the following deployment models will best meet the requirements?

- A. SaaS
- B. PaaS
- **C. IaaS**
- D. FaaS

Answer: C

Explanation:

Infrastructure as a Service (IaaS) is the deployment model that will best meet the requirements of retaining control over the operating systems, patches, and settings of all resources. IaaS provides the cloud infrastructure but leaves the management of the operating system and applications to the user.

Reference: The cloud service models and the level of control they offer are fundamental topics in the CompTIA Cloud+ certification material.

NEW QUESTION # 258

You are a cloud engineer working for a cloud service provider that is responsible for an IaaS offering.

Your customer, who creates VMs and manages virtual storage, has noticed I/O bandwidth issues and low IOPS (under 9000).

Your manager wants you to verify the proper storage configuration as dictated by your service level agreement (SLA).

The SLA specifies:

. Each SFP on the hypervisor host must be set to the maximum link speed allowed by the SAN array. . All SAN array disk groups must be configured in a RAID 5.

. The SAN array must be fully configured for redundant fabric paths. . IOPS should not fall below 14000 INSTRUCTIONS Click on each service processor to review the displayed information. Then click on the drop-down menus to change the settings of each device as necessary to conform to the SLA requirements.

☐

- **A. See the explanation for complete solution**

Answer: A

Explanation:

Based on the SLA requirements and the information provided in the diagram

For the Hypervisor:

Slot A fiber channel card:

Port 1 link speed should be set to 16 Gbps since it's connected to Fabric switch A which supports 16 Gbps.

Port 2 link speed should be set to 8 Gbps because it's connected to Fabric switch B which supports up to 8 Gbps.

Slot B fiber channel card:

Port 1 link speed should be set to 16 Gbps since it's connected to Fabric switch A which supports 16 Gbps.

Port 2 link speed should be set to 8 Gbps because it's connected to Fabric switch B which supports up to 8 Gbps.

NEW QUESTION # 259

A systems administrator notices several VMs are constantly ballooning, while the memory usage of several other VMs is significantly lower than their resource allocation. Which of the following will MOST likely solve the issue?

- A. Cluster placement
- B. Storage tiers
- C. Bandwidth increase
- D. Right-sizing

Answer: D

Explanation:

Right-sizing is the process of allocating the correct amount of resources to a VM. In this case, the VMs that are constantly ballooning are being allocated too much memory. Right-sizing these VMs will reduce the amount of memory that they are allocated, which will prevent them from ballooning.
