

Trustable AD0-E724 Valid Test Question & Leading Offer in Qualification Exams & Verified Adobe Commerce Developer Professional

Question: 4

Magento's command line interface is extended through custom commands defined in the ____ file within a module.
Response:

- A. command.xml
- B. di.xml
- C. config.xml
- D. cli.xml

Answer: D

Question: 5

Which elements should be considered when managing product types in Magento?
(Choose three)
Response:

- A. Product attributes
- B. Shipping methods
- C. Customer segments
- D. Stock availability
- E. Pricing rules

Answer: A,D,E

Question: 6

A merchant has a new product that they would like to upload a video to. What are the steps needed to accomplish this?
Response:

- A. Upload the video under "Images and Video" on the product page, which will upload it to the media folder
- B. Upload the video via SFTP to the media folder, then add the filename to the product under "Images and Video"
- C. Upload the video to YouTube, add the merchants YouTube API key in the Admin, then add the URL to the product
- D. Upload the video directly to the Adobe Commerce media folder and select it from the file manager in the product page

The Adobe AD0-E724 Certification is a valuable certificate that is designed to advance the professional career. With the Commerce Developer Professional (AD0-E724) certification exam seasonal professionals and beginners get an opportunity to demonstrate their

expertise. The Commerce Developer Professional certification exam recognizes successful candidates in the market and provides solid proof of their expertise.

Adobe Commerce Developer Professional Sample Questions (Q68-Q73):

NEW QUESTION # 68

Which log file would help a developer to investigate 503 errors caused by traffic or insufficient server resources on an Adobe Commerce Cloud project?

- A. mysql-slow.log
- B. cloud.log
- C. access.log

Answer: C

Explanation:

The access.log file stores the information about the requests and responses that occur on the web server, such as the IP address, timestamp, request URI, response code, and referer URL. By checking the access.log file, a developer can identify the requests that resulted in 503 errors and the possible causes of those errors, such as traffic spikes, insufficient server resources, or misconfiguration.

To check the access.log file on an Adobe Commerce Cloud project, a developer can use the following command in the CLI:

```
grep -r "\" 50 [0-9]" /path/to/access.log
```

This command will search for any lines in the access.log file that contain a response code starting with 50, which indicates a server error. The developer can then compare the timestamps of those lines with the exception.log and error.log files to find more details about the errors.

Alternatively, if the error has occurred in the past and the access.log file has been rotated (compressed and archived), the developer can use the following command in the CLI (Pro architecture only):

```
zgrep "\" 50 [0-9]" /path/to/access.log.<rotation ID>.gz
```

This command will search for any lines in the compressed access.log file that contain a response code starting with 50. The rotation ID is a number that indicates how many times the log file has been rotated. For example, access.log.1.gz is the most recent rotated log file, and access.log.10.gz is the oldest rotated log file.

NEW QUESTION # 69

When attempting operations that require lengthy processing, a merchant on Adobe Commerce Cloud receives a timeout error after 180 seconds.

How would the developer deal with this issue?

- A. 1. Modify admin timeout into .magento.app.yaml file.
2. Commit and push that code from the local environment.
3. Move code to Production environment.
- B. 1. Modify admin timeout into app/etc/config.php file.
2. Commit and push that code from the local environment.
3. Submit a support ticket to apply the changes.
- C. 1. In the Fastly Configuration section > Advanced Configuration.
2. Set the Admin path timeout value in seconds.
3. Save config and Upload VCL to Fastly.

Answer: C

Explanation:

The developer can deal with this issue by modifying the admin path timeout value in seconds in the Fastly Configuration section > Advanced Configuration in the Admin Panel. Fastly is a cloud-based caching service that improves site performance and security for Adobe Commerce Cloud projects. Fastly has a default timeout value of 180 seconds for admin requests, which means that any request that takes longer than 180 seconds will be terminated and result in a timeout error. The developer can increase this value to allow longer processing time for admin requests without causing errors. The developer also needs to save the configuration and upload VCL to Fastly to apply the changes. Verified References: [Magento 2.4 DevDocs]

NEW QUESTION # 70

ECE-Tools provides a set of tools that can be used to manage and maintain your Adobe Commerce Cloud environment. What are some of the features provided by ECE-Tools?

- A. Fastly configuration, Applies custom patches and Dump configuration for static content deployment.
- **B. Builds application, Applies custom patches and Dump configuration for static content deployment.**
- C. Builds application, Applies custom patches, and Shows the list of S3 backup tar.gz files.

Answer: B

Explanation:

Some of the features provided by ECE-Tools are building application, applying custom patches, and dumping configuration for static content deployment. ECE-Tools is a set of scripts and tools designed to manage and deploy Adobe Commerce Cloud projects. It provides commands for building application code, applying patches for Magento core issues or custom modules, and dumping configuration settings for static content deployment optimization. Verified References: [Magento 2.4 DevDocs] 2 The ECE-Tools package for Adobe Commerce Cloud provides a range of tools and scripts to manage and streamline deployment and maintenance tasks. Among its key features:

* Application Builds:

* ECE-Tools handles the build process, which includes compiling the code, preparing static content, and configuring deployment.

* Applying Custom Patches:

* It includes capabilities for managing and applying custom patches to the Adobe Commerce application during deployment, which is essential for customization and bug fixes.

* Dump Configuration for Static Content Deployment:

* ECE-Tools can dump configuration for static content deployment, optimizing the static content deployment process by handling configurations and assets efficiently.

* Why Option A is Correct:

* Option A lists these core functionalities provided by ECE-Tools. Option B incorrectly includes Fastly configuration, which is managed separately. Option C mentions S3 backups, which are not directly handled by ECE-Tools.

NEW QUESTION # 71

A message queue currently has `queue/consumer-wait-for-messages` set to true, which allows the consumer process to run until a message is inserted into the queue. A piece of functionality is driven by data stored in the model `\Magento\Variable\Model\Variable` and this value is only loaded once during the consumer run. If the variable is updated we want the consumer to restart so that the new value is loaded into memory without having to reload the variable on each message consumed. The Adobe Commerce developer has created an after plugin on the `\Magento\Variable\Model\Variable::save()` function. How would the developer use the plugin to trigger the consumer restart?

- A. Call the function `\Magento\Framework\MessageQueue\Consumers\TriggerRestartInterface::trigger()`.
- B. Set the global Cache key `trigger_consumer_restart` to 1.
- **C. Call the function `\Magento\Framework\MessageQueue\PoisonPill\PoisonPillPutInterface::put()`.**

Answer: C

Explanation:

In Adobe Commerce, when a consumer process needs to restart, the `PoisonPillPutInterface` can be used. The `put()` method of this interface triggers a "poison pill," which signals running consumers to restart. This is particularly useful when updated data needs to be reloaded into memory, as in this scenario with the `\Magento\Variable\Model\Variable`.

Poison Pill Mechanism:

The poison pill method tells the message queue consumer to stop its current process and restart, allowing it to pick up any configuration or data changes that occurred since the last start.

Why Option A is Correct:

By calling `PoisonPillPutInterface::put()`, the consumer will receive a restart signal, which is ideal for cases where data loaded at the beginning of the consumer's lifecycle must be updated.

Option B is incorrect because `TriggerRestartInterface::trigger()` does not exist in the Magento framework.

Option C is also incorrect as setting a cache key alone does not trigger a consumer restart.

Implementation:

Use an after plugin on the `save()` method to trigger `PoisonPillPutInterface::put()` after the variable is saved.

NEW QUESTION # 72

An Adobe Commerce developer is tasked with adding a new export option for the order grid, they have added the following code for the export button within sales_order_grid.xml:

```
<exportButton>
  <settings>
    <options>
      <option name="txt" xsi:type="array">
        <item name="value" xsi:type="string">txt</item>
        <item name="label" xsi:type="string" translate="true">TXT</item>
        <item name="url" xsi:type="string">vendor_module/sales/export/customExport</item>
      </option>
    </options>
  </settings>
</exportButton>
```

Upon testing, they are getting redirected, what would be a cause for this error?

- A. The option's uri attribute is not valid.
- B. The layout cache needs to be refreshed.
- C. The developer has to add a formkey for the new export option.

Answer: C

Explanation:

The developer has to add a formkey for the new export option because the formkey is required for security reasons. Without the formkey, the request will be rejected and redirected to the dashboard page. Verified References: [Magento 2.4 User Guide] [Magento 2.4 DevDocs] When adding custom export options to grids in Magento, it's crucial to include a form key for actions that involve form submission. Magento relies on form keys for CSRF (Cross-Site Request Forgery) protection, so omitting the form key can lead to redirects or failed operations.

* Form Key Requirement:

* In Magento, the form key is a hidden token included in forms to ensure that the request is valid.

This is particularly important for actions that change the state or export data, as it helps prevent unauthorized actions.

* Adding a custom export button triggers a form submission, which requires a valid form key.

Without it, Magento may redirect to a default page or the admin dashboard as a security measure.

* Why Option C is Correct:

* Option C correctly identifies the lack of a form key as the issue. When Magento detects a missing form key in sensitive operations, it defaults to a redirect to maintain security.

* Option A, concerning the URI, is less likely to cause a redirection. Similarly, Option B regarding layout cache would not directly impact CSRF validation, which is the cause of the redirection here.

* Solution:

* Modify the button or form submission logic to include a form key, typically by adding form_key={{formKey}} in the URL parameters or within the form data.

NEW QUESTION # 73

.....

Our company abides by the industry norm all the time. By virtue of the help from professional experts, who are conversant with the regular exam questions of our latest real dumps. The Commerce Developer Professional exam dumps have summarized some types of questions in the qualification examination, so that users will not be confused when they take part in the exam, to have no emphatic answers. It can be said that the template of these questions can be completely applied. The user only needs to write out the routine and step points of the AD0-E724 test material, so that we can get good results in the exams.
