Cisco Designing and Implementing Secure Cloud Access for Users and Endpoints Sample Questions (Q102-Q107):

NEW QUESTION # 102
Which of the following is true about lateral movement prevention strategies?

- A. They include the use of just-in-time access and privilege escalation monitoring
- B. They are only applicable in on-premises environments
- C. They primarily focus on external firewall configuration
- D. They encourage the use of shared credentials

Answer: A

NEW QUESTION # 103
A security analyst detects an employee endpoint making connections to a malicious IP on the internet and downloaded a file named Test0511127691C.pdf. The analyst discovers the machine is infected by trojan malware. What must the analyst do to mitigate the threat using Cisco Secure Endpoint?

- A. Create an IP Block list and add the IP address of the affected endpoint
- B. Identify the malicious IPs and place them in a blocked list
- C. Enable scheduled scans to detect and block the executable files
- D. Start isolation of the machine on the Computers tab

Answer: D

Explanation:
In Cisco Secure Endpoint (formerly AMP for Endpoints), isolating an infected machine is the most immediate action to contain the threat. Isolation cuts the endpoint off from all network communication except to the management console, allowing the analyst to investigate further while preventing lateral movement or data exfiltration.
According to SCAZT Section 6: Threat Response (Pages 114-117), isolation is a recommended first response in the event of malware detection.

NEW QUESTION # 104
Which web application firewall deployment in the Cisco Secure DDoS protects against application layer and volumetric attacks?

- A. On-demand
- B. Active/passive
- C. Always-on
- D. Hybrid

Answer: C

Explanation:
According to the SCAZT guide, the "Always-on" deployment mode for Cisco Secure DDoS (including integration with Secure Web Application Firewall solutions) provides continuous protection for both volumetric and application-layer attacks. This deployment model ensures that all traffic flows through the scrubbing and WAF infrastructure without requiring traffic redirection only during attack events. It provides real-time mitigation and immediate detection, which is essential to address both volumetric attacks (e.g., SYN floods) and Layer 7 (application-layer) attacks such as HTTP floods and injection-based threats.
While "Hybrid" and "On-demand" modes are useful for specific use cases, only "Always-on" offers continuous and comprehensive protection required for environments that demand consistent uptime and threat prevention.
