The ISTQB-Foundation Level Exam (ISTQB-CTFL) Desktop-based practice Exam is ideal for applicants who don't have access to the internet all the time. You can use this ISTQB-Foundation Level Exam (ISTQB-CTFL) simulation software without an active internet connection. This [ISTQB-CTFL](#) software runs only on Windows computers. Both practice tests of 2Pass4sure i.e. web-based and desktop are customizable, mimic ISTQB ISTQB-CTFL real exam scenarios, provide results instantly, and help to overcome mistakes.

We are committed to provide you the best and the latest ISTQB-CTFL training materials for you. Quality of the ISTQB-CTFL exam dumps has got high evaluation among our customers, they think highly of it, since we help them pass the exam easily. Furthermore if we have the updated version, our system will send the [Latest ISTQB-CTFL Exam Dumps](#) to your email address automatically, you don't need to worry about missing the latest version, you just need to concentrate your attention on practicing, and we will do the rest for you.

ISTQB-CTFL certification has great effect in this field and may affect your career even future. ISTQB-CTFL real questions files are professional and has high passing rate so that users can pass exam at the first attempt. Many candidates compliment that ISTQB-CTFL study guide materials are best assistant and useful for qualification exams, they have no need to purchase other training courses or books to study, and only by practicing our ISTQB-CTFL Exam Braindumps several times before exam, they can pass exam in short time easily. What are you waiting for?

The sources and content of our ISTQB-CTFL practice dumps are all based on the real ISTQB-CTFL exam. And they are the masterpieces of professional expertise these area with reasonable prices. Besides, they are high efficient for passing rate is between 98 to 100 percent, so they can help you save time and cut down additional time to focus on the ISTQB-CTFL Actual Exam review only. We understand your drive of the certificate, so you have a focus already and that is a good start.

ISTQB-CTFL Reliable Test Pdf | Valid ISTQB-CTFL Vce

As the development of the science and technology is fast, so the information of the ISTQB-CTFL exam materials changes fast

accordingly. The updated version of the ISTQB-CTFL study guide will be different from the old version. Some details will be perfected and the system will be updated. You will enjoy learning on our ISTQB-CTFL Exam Questions for its wonderful and latest design with the latest technologies applied.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q188-Q193):

NEW QUESTION # 188

Consider the following code

```
int premium=2500;
if (age<30)
{
premium = premium +1500;
}
```

Which options suits for a correct combination of Boundary value and expected result. Assume first number as boundary followed by expected result.

- A. 29, 1500
30. 2500
- B. 29, 2500
30. 1500
- C. 29. 4000
30. 2500
- D. 30, 1500
31,2500

Answer: C

Explanation:

In the given code snippet, the premium is increased by 1500 if the age is less than 30. Therefore, at the boundary value of age 29, the premium should be $2500 + 1500 = 4000$, and at age 30, the premium should remain at its initial value of 2500, as the condition is no longer met. Option B correctly reflects this with 29, 4000 and 30, 2500 as the boundary value and the expected results, respectively.

NEW QUESTION # 189

Which of the following statements best describes how configuration management supports testing?

- A. Configuration management is an approach to interoperability testing where tests are executed in the cloud, as the cloud can provide cost-effective access to multiple configurations of the test environments
- B. Configuration management is an administrative discipline that includes change control, which is the process of controlling the changes to identified items referred to as Configuration Items'
- C. Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation
- D. Configuration management helps reduce testing effort by identifying a manageable number of test environment configurations in which to test the software, out of all possible configurations of the environment in which the software will be released

Answer: C

Explanation:

This answer is correct because configuration management is a process of establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design, and operational information throughout its life. Configuration management helps ensure that all relevant project documentation and software items are uniquely identified in all their versions and therefore can be unambiguously referenced in test documentation. This supports testing by providing traceability, consistency, and control over the test artifacts and the software under test. NEW QUESTION # 190

Which of the following options cover the test types performed during typical system testing phase:

- I. Usability
- II Requirements based scenarios
- III Testing parts of the code in isolation
- IV Correct order of parameters in API calls

- A. I, II
- B. II, IV
- C. I, III
- D. III, IV

Answer: A

Explanation:

System testing is a level of testing performed to evaluate the behavior and quality of a whole software product or system. System testing can include various types of testing, such as:

* I) Usability testing: A type of testing that evaluates how easy, efficient and satisfying it is to use the software product or system from the user's perspective.

* II) Requirements based scenarios testing: A type of testing that verifies that the software product or system meets its specified requirements or user stories by executing realistic scenarios or workflows.

System testing does not include the following types of testing, as they are more suitable for lower levels of testing, such as unit testing or integration testing:

* III) Testing parts of the code in isolation: A type of testing that verifies the functionality and quality of individual software components or units by isolating them from other components or units.

* IV) Correct order of parameters in API calls: A type of testing that verifies the functionality and quality of software components or units that communicate with each other through application programming interfaces (APIs) by checking the correct order and format of parameters in API calls. NEW QUESTION # 191

Which of the following statements about white-box test techniques is true?

- A. Branch coverage is the most thorough code-related white-box test technique, and therefore applicable standards prescribe achieving full branch coverage at the highest safety levels for safety-critical systems
- B. Code-related white-box test techniques are not required to measure the actual code coverage achieved by black-box testing, as code coverage can be measured using the coverage criteria associated with black-box test techniques
- C. Code-related white-box test techniques provide an objective measure of coverage and can be used to complement black-box test techniques to increase confidence in the code
- D. Achieving full statement coverage and full branch coverage for a software product means that such software product has been fully tested and there are no remaining bugs within the code

Answer: C

Explanation:

This answer is correct because code-related white-box test techniques are test design techniques that use the structure of the code to derive test cases. They provide an objective measure of coverage, such as statement coverage, branch coverage, or path coverage, which indicate how much of the code has been exercised by the test cases. Code-related white-box test techniques can be used to complement black-box test techniques, which are test design techniques that use the functional or non-functional requirements of the system or component to derive test cases. By combining both types of techniques, testers can increase their confidence in the code and find more defects. Reference: ISTQB Glossary of Testing Terms v4.0, ISTQB Foundation Level Syllabus v4.0, Section 2.3.2.2

NEW QUESTION # 192

Which of the following statements about error guessing is true?

- A. Experienced testers, when applying error guessing, rely on the use of a high-level list of what needs to be tested as a guide to find defects
- B. Experienced testers, when applying error guessing technique, can anticipate where errors, defects and failures have occurred and target their tests at those issues

- C. Error guessing refers to the ability of a system or component to continue normal operation despite the presence of erroneous inputs
- D. Error guessing is a system that adopts artificial intelligence to predict whether software components are likely to contain defects or not

Answer: B

Explanation:

This answer is correct because error guessing is a test design technique where the experience and intuition of the tester are used to anticipate where errors, defects and failures have occurred or are likely to occur, and to design test cases to expose them. Error guessing can be based on factors such as the complexity of the system or component, the known or suspected weaknesses of the system or component, the previous history of defects, or the common types of errors in the domain or technology. Error guessing can be used as a complementary technique to other more systematic or formal techniques, or when there is insufficient information or time to apply them.
