CheckPoint Check Point Certified VSX Specialist - R81 (CCVS) Sample Questions (Q105-Q110):

NEW QUESTION # 105

Which of the following is a key difference between a physical Security Gateway Cluster and a VSX Gateway Cluster?

- A. VSX clusters can host multiple Virtual Systems on a single cluster
- B. Physical clusters use separate appliances for each policy
- C. VSX clusters do not support ClusterXL
- D. Physical clusters cannot use VRRP

Answer: A

Explanation:

VSX Gateway Clusters can host multiple isolated Virtual Systems within the same clustered infrastructure, while physical clusters typically manage one security policy per gateway instance.

This makes VSX ideal for multi-tenant environments.

NEW QUESTION # 106

How can you verify if SecureXL is enabled on a specific Virtual System?

- A. vsx_util securexl
- **B. fwaccel stat after running vsenv**
- C. cpview > SecureXL tab
- D. fw ctl pstat

Answer: B

Explanation:

To check SecureXL status per VS, switch into the context using vsenv and run fwaccel stat. This will show if SecureXL is enabled and whether traffic is being accelerated (fast path).

NEW QUESTION # 107

To view per-VS memory usage and interface traffic, which monitoring tool should be used?

- A. SmartConsole
- **B. SmartView Monitor**
- C. Gaia Portal
- D. cpinfo

Answer: B

Explanation:

SmartView Monitor enables administrators to drill down into per-VS statistics, including CPU, memory, interface throughput, and concurrent connections. This level of insight is essential for tuning performance and capacity planning.

NEW QUESTION # 108

Which of the following must be configured to deploy a new VSX Gateway cluster? (Choose three)

- A. VS0 static routes
- **B. Dedicated sync interface**
- **C. Virtual MAC (VMAC) configuration**
- **D. ClusterXL configuration**

Answer: B,C,D

Explanation:

Setting up a VSX Cluster requires proper ClusterXL setup, including assigning a sync interface for state synchronization, and configuring VMAC for cluster interface failover. These steps ensure high availability and proper failover behavior in VSX.

NEW QUESTION # 109

In a VSX cluster, what happens if a single cluster member fails?

- **A. Only VSs hosted on that member failover**
- B. All Virtual Systems restart
- C. The cluster goes into debug mode
- D. Sync interface is disabled

Answer: A

Explanation:

With VSLS enabled, only the Virtual Systems hosted on the failed cluster member will fail over to another member. This preserves operational continuity for unaffected VSs and speeds up failover recovery.
