## High Pass-Rate CS0-003 New Questions & Leader in Certification Exams Materials & Effective CS0-003 Latest Exam Experience

First of all, we have the best and most first-class operating system, in addition, we also solemnly assure users that users can receive the information from the CS0-003 learning material within 5-10 minutes after their payment. Second, once we have written the latest version of the CS0-003 learning material, our products will send them the latest version of the CS0-003 Training Material free of charge for one year after the user buys the product. Last but not least, our perfect customer service staff will provide users with the highest quality and satisfaction in the hours.

## CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q250-Q255):

### NEW QUESTION # 250

After conducting a cybersecurity risk assessment for a new software request, a Chief Information Security Officer (CISO) decided the risk score would be too high. The CISO refused the software request. Which of the following risk management principles did the CISO select?

- A. Avoid
- B. Mitigate
- C. Transfer
- D. Accept

**Answer: A**

Explanation:

Explanation

Avoid is a risk management principle that describes the decision or action of not engaging in an activity or accepting a risk that is deemed too high or unacceptable. Avoiding a risk can eliminate the possibility or impact of the risk, as well as the need for any further risk management actions. In this case, the CISO decided the risk score would be too high and refused the software request. This indicates that the CISO selected the avoid principle for risk management.

#### NEW QUESTION # 251

During a scan of a web server in the perimeter network, a vulnerability was identified that could be exploited over port 3389. The web server is protected by a WAF. Which of the following best represents the change to overall risk associated with this vulnerability?

- A. The risk would decrease because a web application firewall is in place.
- **B. The risk would decrease because RDP is blocked by the firewall.**
- C. The risk would increase because the host is external facing.
- D. The risk would not change because network firewalls are in use.

**Answer: B**

Explanation:

Port 3389 is commonly used by Remote Desktop Protocol (RDP), which is a service that allows remote access to a system. A vulnerability on this port could allow an attacker to compromise the web server or use it as a pivot point to access other systems. However, if the firewall blocks this port, the risk of exploitation is reduced.

#### NEW QUESTION # 252

A security analyst received an alert regarding multiple successful MFA log-ins for a particular user. When reviewing the authentication logs, the analyst sees the following:

□ Which of the following are most likely occurring, base on the MFA logs? (Choose two.)

- A. Dictionary attack
- B. Rogue access point
- **C. Subscriber identity module swapping**
- **D. Impossible geo-velocity**
- E. Push phishing
- F. Password spray

**Answer: C,D**

#### NEW QUESTION # 253

While reviewing web server logs, a security analyst found the following line:

```
<IMG SRC='vbscript:msgbox("test")'>
```

Which of the following malicious activities was attempted?

- A. Server-side request forgery
- B. Command injection
- **C. Cross-site scripting**
- D. XML injection

**Answer: C**

Explanation:

XSS is a type of web application attack that exploits the vulnerability of a web server or browser to execute malicious scripts or commands on the client-side. XSS attackers inject malicious code, such as JavaScript, VBScript, HTML, or CSS, into a web page or application that is viewed by other users. The malicious code can then access or manipulate the user's session, cookies, browser history, or personal information, or perform actions on behalf of the user, such as stealing credentials, redirecting to phishing sites, or installing malware.<sup>12</sup> The line in the web server log shows an example of an XSS attack using VBScript. The attacker tried to insert an <IMG> tag with a malicious SRC attribute that contains a VBScript code. The VBScript code is intended to display a message

box with the text "test" when the user views the web page or application. This is a simple and harmless example of XSS, but it could be used to test the vulnerability of the web server or browser, or to launch more sophisticated and harmful attacks<sup>3</sup>

#### NEW QUESTION # 254

An organization conducted a web application vulnerability assessment against the corporate website, and the following output was observed:

Which of the following tuning recommendations should the security analyst share?

- A. Configure an Access-Control-Allow-Origin header to authorized domains.
- B. Set an Http Only flag to force communication by HTTPS.
- C. Disable the cross-origin resource sharing header.
- D. Block requests without an X-Frame-Options header.

**Answer: A**

#### NEW QUESTION # 255

.....

According to personal propensity and various understanding level of exam candidates, we have three versions of CS0-003 practice materials for your reference. Here are the respective features and detailed disparities of our CS0-003 practice materials. Pdf version- it is legible to read and remember, and support customers' printing request, so you can have a print and practice in papers. Software version-It support simulation test system, and times of setup has no restriction. Remember this version support Windows system users only. App online version-Be suitable to all kinds of equipment or digital devices. Be supportive to offline exercise on the condition that you practice it without mobile data.
