## Guidewire InsuranceSuite-Analyst Fundamentals

Study online at [https://quizlet.com/\\_33738](https://quizlet.com/_33738)

- 1. What are the four main areas of configuration in a Guidewire application?:** -  
User Interface  
- Data Model  
- Application Logic  
- Integration
- 2. What are some of the technologies used in InsuranceSuite applications?:** - Page  
Configuration Format (PCF) files  
- Gosu (programming language)
- 3. What are some of the reasons for a non-developer to understand the technology stack?:** - To determine what data is stored and if new requirements need additional data elements  
- To know how and where data is used  
- To communicate what data may be needed beyond what is in the base configuration  
- To determine valid values or circumstances for the new data
- 4. What are some examples of what can be configured in the User Interface?:** -  
The order of fields, change labels regroup fields (simple change)  
- Fields on a screen (moderate change)  
- Screens (complex change)  
- Screen-based logic (complex change)
- 5. What are some examples of what can be configured in the Data Model?:** -  
Information that the base application does not store (add passport number)  
- Values for a Typelist (add valid values for AddressType or PhoneType)  
- Data to support regulatory requirements
- 6. What are the two main components of the data model:** - Entities  
- Typelists
- 7. What is the purpose of the Data Dictionary:** It shows the data elements that belong to entities and typelists.
- 8. What are some of the relationships between entities:** - Foreign keys: a link to a single row in another entity  
- Array keys: a link to multiple rows in another entity  
- Type keys: a link to a specific value in a typelist.

Topic 4	<ul style="list-style-type: none"> <li>Guidewire project phases: This domain outlines the different phases of a Guidewire project lifecycle, including planning, design, development, testing, and deployment.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>Understanding the underlying technology crucial to an analyst: This topic highlights the importance of having a foundational understanding of Guidewire's technology stack to support better analysis and communication with technical teams.</li> </ul>

## Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q87-Q92):

### NEW QUESTION # 87

\_\_\_\_\_ provide starting points for solutions that can be customized and added to the Guidewire products.

- A. User Story Cards
- B. Product Documentation
- C. Accelerators
- D. Extension Packs

**Answer: C**

Explanation:

Accelerators (Option D) are the correct Guidewire term for pre-built solutions provided by Guidewire or its partners (available on the Guidewire Marketplace).

\* Definition: An Accelerator is a software asset that provides a "starting point" for a specific business problem or integration (e.g., a "London Market Accelerator" or a specific "Payment Gateway Accelerator").

\* Purpose: They are designed to be customized. Unlike the core product (which you configure) or a SaaS service (which you consume), an accelerator is often code or configuration that you download, install, and then modify to fit your specific project needs. They are not "plug-and-play" in the strictest sense; they accelerate the development by providing the foundational code.

Why other options are incorrect:

\* B. Extension Packs: While similar, "Extension Packs" (now often referred to as simply Extensions or Standards-based templates) typically refer to smaller, verified add-ons that might not require as much

"customization" as an accelerator. However, "starting point for solutions" is the textbook definition for Accelerators.

\* A. User Story Cards: These are documentation artifacts, not software solutions.

### NEW QUESTION # 88

Which of the following describes what are User Story acceptance criteria?

Choose 2 options.

- A. They describe the value delivered to end-user

- B. They are a checklist of key activities that must be completed in order to accept a story
- C. They tell when a user story is 'done'
- D. They describe the role, the expected action, and the reason why the action is needed

**Answer: B,C**

Explanation:

The correct answers are A and D because acceptance criteria define the conditions that must be satisfied for a user story to be considered complete and acceptable. In Guidewire-style requirements work, user stories capture a business need at a high level, while acceptance criteria add the specific expectations that clarify how the team and stakeholders will know the story has been successfully delivered.

A). They are a checklist of key activities that must be completed in order to accept a story is correct because acceptance criteria function as a practical set of conditions or checkpoints. They guide development, testing, and business validation by making the expected results explicit. Although not always written as task steps, they serve as a measurable list of what must be true before the story is accepted.

D). They tell when a user story is 'done' is also correct because that is one of the main purposes of acceptance criteria. They define the boundaries of completion and help avoid ambiguity about whether the delivered functionality meets the intended requirement. This supports better collaboration among analysts, developers, testers, and business stakeholders.

B is incorrect because describing the value delivered to the end-user is part of the user story itself, not the acceptance criteria. C is also incorrect because describing the role, action, and reason follows the common user story format such as "As a [role], I want [action] , so that [benefit]." That structure defines the story statement, while acceptance criteria define the testable conditions for acceptance.

So, acceptance criteria are best understood as the conditions/checklist used to determine when a story is complete and acceptable .

#### NEW QUESTION # 89

Which areas of the UI provide context-sensitive navigation links to the account functionality of PolicyCenter and the various pages of the account file?

- A. QuickJump Box
- B. Screen Area
- C. Tab Bar
- D. Info Bar
- E. Sidebar
- F. Workspace

**Answer: C,E**

Explanation:

Comprehensive and Detailed Explanation (250-300 words):

In Guidewire PolicyCenter, navigation is designed to provide both high-level access and context-sensitive navigation within a selected business object such as an account.

The Tab Bar (Option D) provides high-level navigation across major functional areas of the application, including Accounts, Policies, Claims, and Administration. It allows users to quickly access the account search and account-related workflows.

Once an account is opened, the Sidebar (Option F) becomes the primary context-sensitive navigation area. It displays links to specific pages within the account file, such as Account Summary, Contacts, Policies, and Activities. The sidebar updates dynamically based on the selected object, making it essential for navigating within the account context.

The remaining options do not provide context-sensitive account navigation. The Info Bar summarizes context, the QuickJump Box supports navigation shortcuts, the Workspace shows supplementary information, and the Screen Area displays page details.

#### NEW QUESTION # 90

During the Inception phase for a new marine insurance product, an elaboration session is being held.

What are two key responsibilities of participants in these sessions to help achieve the objectives of the workshop?

- A. Writing Gosu code to implement complex business logic
- B. Performing end-to-end regression testing of the configured solution
- C. Creating detailed UI mockups for all base system screens
- D. Focusing on the happy path of the requirement first, then edge cases
- E. Reviewing the standard process flows and how they tie back to Guidewire product functionality
- F. Formalizing the sprint backlog with tasks assigned to individual developers

**Answer: D,E**

Explanation:

Elaboration sessions conducted during the Inception phase are designed to validate scope, align stakeholders, and ensure a shared understanding of how Guidewire InsuranceSuite supports business needs. These sessions are exploratory and collaborative rather than execution-focused.

Two key participant responsibilities during elaboration sessions are focusing on the happy path first, followed by edge cases, and reviewing standard process flows in relation to Guidewire product functionality, making Options A and B correct.

Starting with the happy path allows participants to validate the primary business scenario without unnecessary complexity. Once the core flow is understood and agreed upon, edge cases and exceptions can be discussed in context. This approach aligns with Guidewire's recommended practice of leveraging out-of-the-box functionality before introducing complexity.

Reviewing standard process flows and mapping them to Guidewire functionality ensures that stakeholders understand what the product already provides. This helps avoid over-customization and supports the "configure over customize" principle central to Guidewire implementations.

The remaining options are not objectives of elaboration sessions. Creating detailed UI mockups (Option C), formalizing sprint tasks (Option D), writing Gosu code (Option E), and performing regression testing (Option F) all occur in later phases of the project lifecycle.

Elaboration sessions are successful when they focus on understanding, validation, and alignment—setting the stage for efficient and predictable delivery.

### NEW QUESTION # 91

The screen location information can be interrogated by selecting the following keys on your keyboard:

- A. ALT + SHIFT + W
- B. ALT + CTRL + I
- C. ALT + SHIFT + T
- **D. ALT + SHIFT + I**
- E. ALT + CTRL + T
- F. ALT + CTRL + W

**Answer: D**

Explanation:

Guidewire provides built-in UI inspection capabilities that allow analysts and developers to identify screen location and PCF file information at runtime. This is especially useful during requirements clarification, defect analysis, and UI discussions.

By pressing ALT + SHIFT + I (Option E), users can interrogate the screen to view metadata such as the PCF file name and UI component location. This shortcut helps teams quickly identify where UI elements are configured without searching through the project manually.

Understanding this capability enables analysts to communicate more precisely with developers when discussing UI changes or defects.

### NEW QUESTION # 92

.....

It is a truth universally acknowledged that the exam is not easy but the related InsuranceSuite-Analyst certification is of great significance for workers in this field so that many workers have to meet the challenge, I am glad to tell you that our company aims to help you to pass the examination as well as gaining the related certification in a more efficient and simpler way. During recent 10 years, our InsuranceSuite-Analyst Exam Questions have met with warm reception and quick sale in the international market. Our InsuranceSuite-Analyst study materials are not only as reasonable priced as other makers, but also they are distinctly superior in the following respects.
