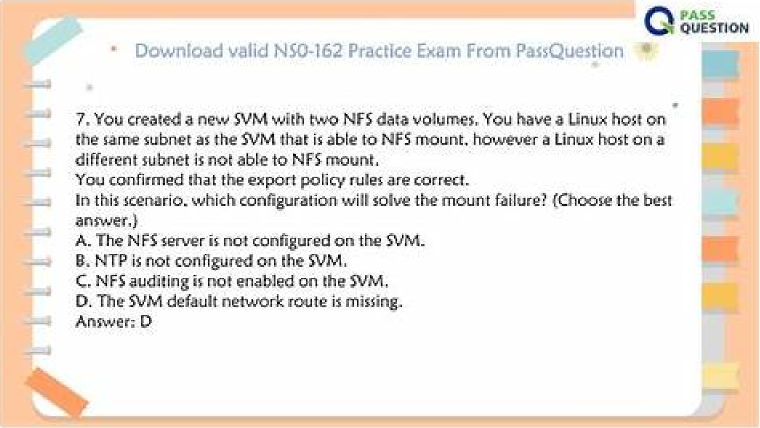
Lab NS0-185 Questions | NS0-185 Valid Exam Discount



- Download valid NS0-162 Practice Exam From PassQuestion

7. You created a new SVM with two NFS data volumes. You have a Linux host on the same subnet as the SVM that is able to NFS mount, however a Linux host on a different subnet is not able to NFS mount.
You confirmed that the export policy rules are correct.
In this scenario, which configuration will solve the mount failure? (Choose the best answer.)
A. The NFS server is not configured on the SVM.
B. NTP is not configured on the SVM.
C. NFS auditing is not enabled on the SVM.
D. The SVM default network route is missing.
Answer: D

One such trustworthy point about exam preparation material is that it first gains your trust, and then asks you to purchase it. Everyone can get help from PassSureExam's free demo of Network Appliance NS0-185 exam questions. Our NetApp Storage Installation Engineer, ONTAP Professional Exam exam questions never remain outdated! Take a look at our Free Network Appliance NS0-185 Exam Questions And Answers to check how perfect they are for your exam preparation. Once you buy it, you will be able to get free updates for NetApp Storage Installation Engineer, ONTAP Professional Exam exam questions for up to 1 year.

These practice tools are developed by professionals who work in fields impacting Network Appliance certification, giving them a foundation of knowledge and actual competence. Our Network Appliance NS0-185 Exam Questions are created and curated by industry specialists. PassSureExam Is Here To Provide Top-Notch Network Appliance NS0-185 Exam Questions

>> Lab NS0-185 Questions <<

NS0-185 Valid Exam Discount, Study NS0-185 Material

There are many advantages of our Network Appliance NS0-185 pdf torrent: latest real questions, accurate answers, instantly download and high passing rate. You can totally trust our Network Appliance NS0-185 Practice Test because all questions are created based on the requirements of the certification center.

Network Appliance NetApp Storage Installation Engineer, ONTAP Professional Exam Sample Questions (Q121-Q126):

NEW QUESTION # 121
An administrator issued the cluster setup command and configured a 2-node ONTAP 9.8 cluster.
In this scenario, which tool would the administrator use to validate the configuration?

- A. Active IQ Config Advisor
- B. Active IQ Upgrade Advisor
- C. NetAppDocs
- D. Interoperability Matrix Tool

Answer: A

Explanation:
After cluster setup, NetApp best practices require validating hardware, cabling, HA configuration, and system settings.Active IQ Config Advisoris the primary tool used for post-installation validation. It checks cabling correctness, HA pathing, disk ownership, network configuration, firmware versions, and other critical installation parameters.
The other tools listed are used for planning, documentation, or upgrades, not configuration validation.

NEW QUESTION # 122

You are preparing to add a 2-node AFF A250 system to an existing 4-node AFF A800 cluster with Cisco Nexus 3232C switches. The cluster switches are currently running the Cluster-HA RCF.
In this scenario, which two steps are required to install the AFF A250 system? (Choose two.)

- A. Load the Storage RCF
- B. Cable the AFF A250 nodes to the next free ports on the switch.
- C. Load the Cluster-HA-Breakout RCF
- D. Cable the AFF A250 nodes to the breakout ports on the switch.

Answer: C,D

Explanation:
AFF A250 systems use25GbE ports with breakout cablingfor cluster and HA traffic. When adding these nodes to switches running a standard Cluster-HA RCF, the switches must be updated to aCluster-HA- Breakout RCFto support breakout ports. The nodes must then be cabled to the breakout ports. Therefore,B and Dare correct.

NEW QUESTION # 123
When you start a new Service Event Report, what must be entered first?

- A. the project number
- B. the node serial number
- C. the case ID number
- D. the sales order number

Answer: B

Explanation:
A Service Event Report (SER) is used to document installation, maintenance, or corrective actions performed on NetApp systems. Thenode serial numberis the primary identifier used to associate the report with specific hardware.
Other identifiers such as case ID, project number, or sales order number are supplementary and may not always exist at the time the SER is created.
Therefore, the correct answer isC (the node serial number).

NEW QUESTION # 124
After you install an AFF A700 2-node cluster with DS224C shelves, Config Advisor reports that your SAS cabling is in mixed-path HA. You expected the SAS cabling be in quad-path HA.
You physically verify the LED status on the controllers and the shelves and notice no irregularities. However, a reboot of the SAS expander does not change the output.
In this scenario, what should you do next?

- A. Re-seat the SAS IO modules of the affected AFF A700 controller.
- B. Use multipath HA because it is the only cabling supported on an AFF A700 controller.
- C. Disconnect the disk shelves from the controller and run Config Advisor again.
- D. Open a case with NetApp Support and turn off the disk shelves until the issue is solved.

Answer: A

Explanation:
This is a post-install validation and troubleshooting scenario for SAS shelf cabling. ONTAP hardware installation guidance distinguishes betweenmultipath/tri-pathandquad-pathconfigurations based on how shelves are cabled. For shelves with IOM12/IOM12B modules, quad-path configurations requiredouble-wide shelf-to-shelf connectivity: first using the standard connections (IOM ports 3 and 1) and then adding double- wide connections (IOM ports 4 and 2). If quad-path HA is intended but Config Advisor reportsmixed-path HA, then ONTAP's view of the end-to-end SAS topology does not match the expected double-wide design.
The question states LEDs look normal and rebooting the SAS expander did not change the status. That reduces the likelihood of a transient expander condition and shifts focus tophysical seating/connection integrity. In installation practice, a common next corrective step is tore-seat the SAS I/O modules(IOMs on the shelf side or SAS modules/adapters on the controller side depending on platform architecture). Reseating is a controlled, practical action to address partial lane connectivity, marginal contacts, or module insertion issues that can still present as "connected" at an LED level but result in ONTAP detecting fewer active paths than expected.

Option D is incorrect because multipath HA is not "the only" supported method on such platforms; ONTAP documentation explicitly describes quad-path ("double-wide") cabling rules and steps. Option B (disconnect and rerun Config Advisor) is destructive and does not correct the underlying condition; it is more of a diagnostic reset than a validated next fix step, and it risks creating additional variables. Option A (open a case and power off shelves) is premature given there is a clear, standard physical remediation action remaining.
Therefore, the correct next step is tore-seat the SAS IO modulesof the affected controller.

NEW QUESTION # 125
Your customer wants to know more about the network configuration within the cluster.
In this scenario, which statement is correct about a LIF?

- A. A LIF is created within a broadcast domain and contains a pool of IP addresses.
- B. A LIF is an IP address or a WWPN that is associated with a port.
- C. A LIF separates network domains to access cluster data.
- D. A LIF is a port that provides physical connections.

Answer: B

Explanation:
In ONTAP SAN concepts, aLogical Interface (LIF)represents a logical network access point used by clients, hosts, or internal cluster services to communicate with storage. A LIF is not a physical port; rather, it is an abstraction that allows ONTAP to provide network resiliency and flexibility.
A LIF can be defined as either anIP address(used for NAS, management, and intercluster traffic) or aWorld Wide Port Name (WWPN)(used for SAN protocols such as FC and FCoE). Each LIF is associated with a physical port but can fail over to other ports based on defined policies, ensuring continuous access during failures or maintenance.
Broadcast domains define Layer 2 network groupings for ports, but they do not contain pools of IP addresses.
IP address pools are defined insubnets, not broadcast domains. Physical ports provide connectivity, but they do not represent LIFs themselves. Separating network domains is handled byIPspaces, not LIFs.
Therefore, the correct description of a LIF is that it isan IP address or WWPN associated with a port, making optionCcorrect.

NEW QUESTION # 126
