Role of ISTQB ISTQB-CTFL Exam Questions in Getting the Highest-Paid Job

The most amazing part of our ISTQB-CTFL exam questions is that your success is 100% guaranteed. As the leader in this career for over ten years, we have enough strenght to make our ISTQB-CTFL study materials advanced in every sigle detail. On one hand, we have developed our ISTQB-CTFL learning guide to the most accurate for our worthy customers. As a result, more than 98% of them passed the exam. On the second hand, our services are considered the best and the most professional to give guidance for our customers.

ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q356-Q361):

NEW QUESTION # 356

Metrics can be collected during and at the end of testing activities to assess which of the following?

- i. Progress against the planned schedule and budget.
- II. Current quality of the test object.
- Hi. Adequacy of the test approach.
- iv. Effectiveness of the test activities with respect to the objectives.
- v. All the above.

Select the correct answer:

- **A. Only v.**
- B. Only i and ii.
- C. Only I, ii and iv.
- D. Only i and iii.

Answer: A

Explanation:

Metrics can be collected during and at the end of testing activities to assess various aspects including progress against the planned schedule and budget, the current quality of the test object, the adequacy of the test approach, and the effectiveness of the test activities with respect to the objectives. Collecting these metrics helps in understanding the overall performance and quality of the testing process.

NEW QUESTION # 357

Testing Quadrants, as a model, is effective in aligning stakeholders within Agile teams.
Which of the following examples demonstrates this?

- A. Using Testing Quadrants, the test manager is able to measure and communicate test coverage to all stakeholders.
- **B. Using Testing Quadrants, the test manager is able to differentiate and describe the types of tests to all stakeholders.**
- C. Using Testing Quadrants, the test manager is able to communicate potential product risk to all stakeholders.
- D. Using Testing Quadrant, the test manager is able to prioritize defects by linking these to a specific type of test.

Answer: B

Explanation:

The Testing Quadrants model helps Agile teams by categorizing different types of tests and their purposes.

This differentiation helps test managers explain the testing strategy to all stakeholders, ensuring everyone understands the scope and objectives of each test type. This model aids in planning, executing, and tracking testing activities across different quadrants, making it easier to align with stakeholders' expectations and project goals. NEW QUESTION # 358

A company wants to reward each of its salespeople with an annual bonus that represents the sum of all the bonuses accumulated for every single sale made by that salesperson. The bonus for a single sale can take on the following four values: 3%, 5%, 7% and 10% (the percentage refers to the amount of the single sale). These values are determined on the basis of the type of customer (classified as "Basic" or "Premium") to which such sale was made, and on the amount of such sale classified into the following three groups G1, G2 and G3:

* [G1]: less than 300 euros

* [G2]: between 300 and 2000 euros

* [G3]: greater than 2000 euros

Which of the following is the minimum number of test cases needed to cover the full decision table associated with this scenario?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The minimum number of test cases needed to cover the full decision table associated with this scenario is 6.

This is because the decision table has 4 conditions (type of customer and amount of sale) and 4 actions (bonus percentage). The conditions have 2 possible values each (Basic or Premium, and G1, G2 or G3), so the total number of combinations is $2 \times 2 \times 2 \times 2 = 16$. However, not all combinations are valid, as some of them are contradictory or impossible. For example, a sale cannot be both less than 300 euros and greater than 2000 euros at the same time. Therefore, we need to eliminate the invalid combinations and keep only the valid ones.

The valid combinations are:

Type of customer

Amount of sale
 Bonus percentage
 Basic
 G1
 3%
 Basic
 G2
 5%
 Basic
 G3
 7%
 Premium
 G1
 5%
 Premium
 G2
 7%
 Premium
 G3
 10%

These 6 combinations cover all the possible values of the conditions and actions, and they are the minimum number of test cases needed to cover the full decision table.

NEW QUESTION # 359

Which ONE of the following statements about acceptance testing is NOT correct?

- A. Acceptance testing is the last level of testing performed prior to system release.
- B. The customers or system users are often responsible for the acceptance testing.
- C. Testing of disaster recovery and backup/restore is usually NOT part of acceptance testing.
- D. The main goal of acceptance testing is to build confidence in the system, not find defects.

Answer: C

Explanation:

Acceptance testing is a level of testing performed to verify that a software product meets the agreed acceptance criteria and is acceptable for delivery. Acceptance testing is often performed by the customers or system users, who are the main stakeholders of the software product. The main goal of acceptance testing is to build confidence in the system, not find defects, as defects should have been detected and fixed in earlier levels of testing. Acceptance testing is the last level of testing performed prior to system release, unless there are any changes or fixes that require re-testing. Testing of disaster recovery and backup/restore is usually part of acceptance testing, as these are important aspects of system reliability and security that affect the customer satisfaction and trust. Therefore, statement A is not correct, while statements B, C and D are correct. Verified References: A Study Guide to the ISTQB Foundation Level 2018 Syllabus - Springer, Chapter 2, page 20-21.

NEW QUESTION # 360

Which of the following statements about re-testing and regression testing are TRUE?

- I Re-testing should be performed after a defect is fixed.
- II Regression testing should always be performed after a defect is fixed.
- III. Re-testing and regression testing may be performed at any test level.
- IV Regression testing may include functional, non-functional and structural testing.
- V. Re-testing should be included in the debugging activity.

- A. II, IV, V
- B. I, III, IV
- C. II, V
- D. I, III

Answer: B

Explanation:

The following statements about re-testing and regression testing are true:

* I) Re-testing should be performed after a defect is fixed. Re-testing is a type of testing that verifies that a defect has been successfully resolved by executing a test case that previously failed due to that defect.

Re-testing should be performed after a defect is fixed and delivered to ensure that it does not cause any new failures or side effects.

* III) Re-testing and regression testing may be performed at any test level. Re-testing and regression testing are not limited to a specific test level, but can be applied at any level depending on the context and objectives. For example, re-testing and regression testing can be performed at unit level, integration level, system level or acceptance level.

* IV) Regression testing may include functional, non-functional and structural testing. Regression testing is a type of testing that verifies that previously tested software still performs correctly after changes.

Regression testing may include various types of testing depending on the scope and purpose of the changes. For example, regression testing may include functional testing to check if the software meets its requirements, non-functional testing to check if the software meets its quality attributes, or structural testing to check if the software meets its design or code standards. The following statement about re-testing and regression testing is false:

* II) Regression testing should always be performed after a defect is fixed. Regression testing is not always necessary after a defect is fixed, as some defects may have a low impact or low likelihood of affecting other parts of the software. Regression testing should be performed after a defect is fixed only

* if there is a risk of introducing new defects or causing existing defects due to the changes made to fix the defect. Verified
