It is important to mention here that the UiPath-ABAv1 practice questions played important role in their UiPath Certification Exams preparation and their success.

UiPath Certified Professional Automation Business Analyst Professional v1.0 Sample Questions (Q119-Q124):

NEW QUESTION # 119

How can attended process execution be scheduled?

- A. Only from Orchestrator
- B. Only from Assistant
- C. They cannot be scheduled but users can set reminders
- D. Both from Assistant and Orchestrator

Answer: C

Explanation:

Attended process execution in UiPath cannot be scheduled in the same way as unattended processes. However, users can set

reminders using the UiPath Assistant. While the Assistant allows for reminders to be set, it does not schedule the process to run automatically. The user must manually start the process after being reminded.

This is in contrast to unattended processes, which can be scheduled to run automatically at specified times through the Orchestrator¹².

References: The explanation is based on the UiPath Community Forum discussions and the UiPath Documentation Portal's information on scheduling processes¹².

NEW QUESTION # 120

How can a Business Analyst measure the success of an automation implementation using UiPath?

- A. By tracking the accuracy and completeness of the automation process compared to manual execution
- B. By tracking the number of errors and exceptions that occur during the execution of the automation process
- **C. By tracking the level of customer satisfaction and business value generated by the automation process**
- D. By tracking the total amount of time the automation process has been executed

Answer: C

Explanation:

A Business Analyst can measure the success of an automation implementation using UiPath by tracking the level of customer satisfaction and business value generated by the automation process. This involves evaluating how the automation has improved service delivery, reduced errors, and contributed to overall business goals, which are direct indicators of its impact and effectiveness. NEW QUESTION # 121

What is the difference between a business exception and an application exception in UiPath Orchestrator?

- A. A business exception is an expected and planned part of the process, while an application exception is an unexpected error or failure
- **B. A business exception is raised by the automation workflow while an application exception is raised by the underlying application being automated**
- C. A business exception is used to stop and restart a job while an application exception is used to terminate a job
- D. business exception is handled by the robot, while an application exception is handled by the Orchestrator

Answer: B

Explanation:

Questions no: 56

In UiPath Orchestrator, a business exception refers to an error that arises due to the business logic or process rules not being met. It is an exception that is expected and can be planned for within the workflow. On the other hand, an application exception describes an error that is rooted in a technical issue, such as an application not responding or a system failure. This type of exception is unexpected and is related to the applications or systems that the robot interacts with¹.

References: The distinction between business exceptions and application exceptions is outlined in the UiPath Documentation Portal, specifically in the section "Business Exception Vs Application Exception" found at <https://docs.uipath.com/orchestrator/standalone/2023.10/user-guide/business-exception-vs-application-exception1>.

NEW QUESTION # 122

By what step at most should the analysis of input and its future standardization be decided upon?

- A. During talks with the SME and Business Owner
- **B. During process analysis**
- C. During To-Be process documentation
- D. During As-Is process documentation

Answer: B

Explanation:

The analysis of input and its future standardization should ideally be decided upon during the process analysis phase. This phase involves a detailed review of the current process inputs and outputs, identifying variations, and establishing standardization

requirements. During process analysis, a thorough examination of all elements related to the workflow is conducted, which enables the identification of areas where standardization can lead to greater efficiency and consistency. Deciding on standardization at this stage helps ensure that the designed automation will be robust, scalable, and aligned with the organization's goals.

References: The information is based on the UiPath Automation Business Analyst Learning Plans and the Automation Business Analysis Fundamentals course available on the UiPath Academy, which addresses topics covered in the UiPath Automation Business Analyst (UiABA) certification exam

NEW QUESTION # 123

What are the main functionalities provided by Assisted Task Mining to enhance task understanding and analysis?

- A. It captures the actions performed by the mouse clicks and system logs.
- **B. It allows you to capture variations of tasks, merge these variations for a comprehensive understanding, edit the task graph, and accelerate actionability by generating essential assets.**
- C. It disregards the task graph and focuses only on the annotation of actions.
- D. It only focuses on generating PDD and XAML files, ignoring the variations or illustration of tasks.

Answer: B

Explanation:

Understanding Assisted Task Mining (ATM):

Assisted Task Mining focuses on enhancing the understanding of known tasks by capturing user actions, analyzing variations, and generating actionable outputs like PDDs and automation skeletons.

Why Option A is Correct:

Capturing task variations and merging them into a comprehensive map ensures end-to-end task analysis.

Editing task graphs and annotating actions facilitates deeper analysis and provides clear insights for automation.

Essential outputs like PDDs and XAML files accelerate the implementation process.

Why Other Options Are Incorrect:

Option B: Focusing solely on mouse clicks and system logs limits the scope of task analysis.

Option C: ATM does not ignore variations; it integrates them for a better understanding.

Option D: Disregarding the task graph would overlook a critical analysis tool.
